Power Macintosh 7600/200 Series: Technical Specifications (2/97)

Article Created: 24 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains the technical specifications for the Power Macintosh 7600/200 series computer.

Note: This product is available in Japan ONLY.

DISCUSSION -----

Processor

- * 200-MHz PowerPC 604e microprocessor
- * Integrated floating-point unit and 64K cache
- * Processor is mounted on a removable card for easy upgrades

Memory

- * 32 MB of RAM, expandable to 512 MB via 8 DIMM sockets
- * 4 MB of ROM
- * 256K level 2 cache

Disk drives

- * Internal 2 GB Fast SCSI hard disk
- * Internal Apple SuperDrive floppy disk drive
- * Accepts high-density 1.4MB disks and 800K disks
- * Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal 12x-speed CD-ROM drive
- * Expansion bay for additional 3.5-inch hard disk

Interfaces

- * Composite connectors (RCA phono jacks) for composite video input

- * S-video input connector
- * Internal digital audio/video (DAV) connector for video compression/decompression card
- * Three PCI expansion slots compatible with PCI 2.0-compliant cards
- * Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and GeoPort cables
- * 10BASE-T and AAUI-15 Ethernet connectors; optional PC Compatibility Cards provide multinode support for simultaneous network connections
- * Internal Fast SCSI bus (up to 10 MB/s)
- * External SCSI bus (up to 5 MB/s)
- * Apple Desktop Bus (ADB) expansion port
- * RCA phono jacks for line-level stereo audio input and output
- * Mini jacks for stereo audio input and output
- * All sound ports support 16-bit audio and up to 44.1-kHz sampling rate
- * DB-15 connector for monitor

Video capabilities

- * Real-time video play through of up to 640 by 480 pixels with NTSC; 768 by 576 pixels with PAL and SECAM
- * Up to 320- by 240-pixel capture at 15 frames per second with NTSC
- * Maximum capture size of 640 by 480 pixels with NTSC

Graphics support

- * 2 MB of VRAM, expandable to 4 MB
- * Fast 64-bit data path to VRAM
- * Support for display resolutions of up to 1,280 by 1,024 pixels
- * 24-bit color up to 1,152- by 870-pixel resolution
- * Refresh rate of up to 75 Hz

GeoPort telephony

- * 28.8-Kbps modem support
- * V.17 fax support
- * GeoPort Fax and GeoPort Telephony software included
- * Speaker phone and answering-machine capability

Note: Requires GeoPort Telecom Adapter

Clock/calendar

- * Custom integrated circuit with long-life battery

Keyboard and mouse

- * Includes keyboard and ADB Mouse II

Electrical requirements and compliance

- * Line voltage: 100 to 1225/220 to 240 V AC, RMS single phase
- * Frequency: 50 to 60 Hz, single phase
- * Power: 150 W maximum, not including display ADB power requirements

- * Maximum current draw for all devices: 500 mA (a maximum of three ADB devices is recommended)
- * Mouse draws 10 mA
- * Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

- * Height: 6.15 in. (15.6 cm)
- * Width: 14.37 in. (36.5 cm)
- * Depth: 16.93 in. (43.0 cm)
- * Weight: 22 lb. (9.97 kg)

Environmental requirements

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116 F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95% noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Power Macintosh 8600/200 Series: Description (2/97)

Revised: 3/19/97
Security: Everyone

Power Macintosh 8600/200 Series: Description (2/97)

=====

Article Created: 24 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains a description of the Power Macintosh 8600/200 series computer.

DISCUSSION -----

If your profession demands a high-performance, expandable computer that's optimized for complex work with media and other demanding tasks, choose the Power Macintosh 8600/200 system. This high-performance computer includes built-in video-in and video-out capabilities in an innovative new design. It includes features that make it an ideal choice for in-house publishing, media authoring, and technical applications. And because its processor is mounted on a removable card for easy and inexpensive upgrade to faster processor cards (as available), you can protect your investment for the future.

The new tower design of the Power Macintosh 8600/200 provides incredibly easy system access for upgrades and servicing, new security features, and a built-in Iomega Zip drive for fast, easy storage or backup. In addition, built-in near-broadcast-quality video-input/output capabilities, high-resolution graphics, an AV-capable hard disk drive, a 12x-speed CD-ROM drive, and CD-quality stereo sound add vitality to professional projects and--with Apple's QuickTime software--make media authoring easy.

The three industry-standard Peripheral Component Interconnect (PCI) high-performance expansion slots on these systems let you customize them easily to meet your needs more precisely. You can find PCI cards for a variety of uses, including graphics, storage, and high-speed networking. And if you want to use your Power Macintosh 8600/200 to run MS-DOS and Windows applications as well as software written for the Macintosh, you can install a PC Compatibility Card from Apple in one of the PCI slots--and switch instantly between computing environments. In addition, connecting your Power Macintosh 8600/200 computer to an Ethernet network is easy because it includes both AAUI and 10BASE-T0

connectors.

Today, more and more computer users are discovering the wealth of information and communications resources and opportunities offered by the Internet. The Power Macintosh 8600/200 makes it easy to get involved in this rapidly expanding community, because it comes with all of the software you need for easy Internet access.

The Power Macintosh 8600/200: exceptional performance for media authoring or any work with video, audio, or graphics--to enhance your creativity.

Features

=====

High performance

- * 200-MHz PowerPC 604e processor
- * Built-in Iomega Zip drive
- * Built-in floating-point processor and 64K cache
- * 256K level 2 cache on a DIMM
- * Built-in graphics acceleration

Communications and multimedia

- * 64-bit VRAM graphics subsystem
- * Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- * 12x-speed CD-ROM drive
- * 16-bit stereo audio input and output
- * 24-bit composite and S-video input and output
- * Support for speech-recognition and text-to-speech capabilities
- * Optimized for QuickTime Conferencing software

Expandability

- * Removable processor card allows easy upgrades
- * Three industry-standard PCI expansion slots
- * SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- * Internal expansion bays for additional storage devices (3.5-inch and 5.25-inch)

Compatibility

- * Includes 10BASE-T and AAUI Ethernet connectors
- * Supports Open Transport networking software (TCP/IP and AppleTalk)
- * Runs 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- * Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- * Runs MS-DOS and Windows applications via optional PC Compatibility Cards
- * Comes with all of the software required for Internet access

System 7.5.5 software

- * Makes working with different applications consistent, so they're easier to

learn and use

- * Allows easy customization of your Macintosh to reflect the way you work
- * Provides active assistance in learning new features with Apple Guide
- * Includes MacLinkPlus file translation software from DataViz

Ordering Information

=====

* Power Macintosh 8600/200

Order No. M5453LL/A

Power Macintosh 8600/200 computer with 32 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 2 GB hard disk drive, an internal 12x-speed CD-ROM drive, an internal Iomega Zip drive, and a PlainTalk microphone. Includes keyboard and mouse; system software version 7.5.5 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

Optional Enhancements

* GeoPort Telecom Adapter Kit

Order No. M5438LL/A

* PC Compatibility Card Solutions

- PC Compatibility Card with Pentium 100-MHz processor

Order No. M4092LL/A

- PC Compatibility Card with 100-MHz 586 processor

Order No. M4091LL/A

* Apple QuickDraw 3D Accelerator Card

Order No. M4333LL/A

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

- * GeoPort Fax and GeoPort Telephony software included
- * Speakerphone and answering-machine capability

Note: Requires GeoPort Telecom Adapter

Clock/calendar

- * Custom integrated circuit with long-life battery

Keyboard and mouse

- * Includes keyboard and ADB Mouse II

Electrical requirements and compliance

- * Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
- * Frequency: 50 to 60 Hz, single phase
- * Power: 390 W maximum, not including display ADB power requirements
- * Maximum current draw for all devices: 500 mA (a maximum of three ADB devices is recommended)
- * Mouse draws 10 mA
- * Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

- * Height: 17.3 in. (44.0 cm)
- * Width: 9.7 in. (24.6 cm)
- * Depth: 17.3 in. (44.0 cm)
- * Weight: 35.0 lb. (15.9 kg)

Environmental requirements

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95% noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Power Macintosh 9600 Series: Description (2/97)

Article Created: 24 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains a description of the Power Macintosh 9600 series computers.

DISCUSSION -----

The Apple Power Macintosh 9600/200MP and 9600/200 computers are the top of the line in speed, performance, expandability, and upgradability, which is tremendous news for publishers--particularly those who are working with advanced color--as well as for multimedia professionals and engineers.

The Power Macintosh 9600/200MP computer is a multiprocessor system with two 200-megahertz PowerPC 604e chips, which provides simple, but powerful performance improvements for applications that take advantage of its multiprocessing capabilities. The Power Macintosh 9600/200 features a single 200-megahertz PowerPC 604e processor.

Both Power Macintosh 9600 systems make use of a new tower design that provides incredibly easy system access for upgrades and servicing, and new security features. In addition, a number of noted developers of graphics, video, and scientific/technical applications for the Mac OS are revamping their programs specifically to take advantage of the multiprocessing capabilities of the Power Macintosh 9600/200MP. These capabilities can provide significant performance improvements in processor-intensive applications such as color, publishing, video-editing, and 3D modeling.) If you want to run MS-DOS and Windows applications--you can install a PC Compatibility Card from Apple in one of the system's many PCI slots--and switch instantly between the computing environments.

With six expansion slots that support the industry-standard high-performance Peripheral Component Interconnect (PCI) architecture, these two systems are also the most customizable, expandable Macintosh computers available today. What's

more, these systems also include a 12x-speed CD-ROM drive for fast, easy access to CD-ROM-based materials.

On the communications front, these computers support both 10BASE-T and AUI Ethernet connections. And they include all of the software you need for easy Internet access.

So whether you're involved in publishing, multimedia, or engineering--or simply want an incredibly powerful, expandable, and versatile Macintosh computer--one of the Power Macintosh 9600 systems is sure to meet your needs.

Features

=====

High performance

- * One or two 200-MHz PowerPC 604e processors
- * Built-in floating-point processor and 64K cache
- * 512K level 2 cache

Communications and multimedia

- * Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- * 12x--speed CD-ROM drive
- * 16-bit stereo audio input and output
- * Support for speech-recognition and text-to-speech capabilities

Expandability

- * Removable processor card allows easy upgrades
- * Six industry-standard PCI expansion slots
- * Dual-channel SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- * Internal expansion bays for additional storage devices (3.5-inch and 5.25-inch)

Compatibility

- * Includes 10BASE-T and AUI Ethernet connectors
- * Supports Open Transport networking software (TCP/IP and AppleTalk)
- * Runs 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- * Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- * Runs MS-DOS and Windows applications via optional PC Compatibility Cards
- * Comes with all of the software required for Internet access

System 7.5.5 software

- * Makes working with different applications consistent, so they're easier to learn and use
- * Allows easy customization of your Macintosh to reflect the way you work
- * Provides active assistance in learning new features with Apple Guide

* Includes MacLinkPlus file translation software from DataViz

Iomega Zip Drive: Purpose of Iomega Guest (5/97)

Revised: 5/5/97
Security: Everyone

Iomega Zip Drive: Purpose of Iomega Guest (5/97)

=====

Article Created: 24 January 1997
Article Reviewed/Updated: 5 May 1997

TOPIC -----

I have a Macintosh computer which included an Iomega Zip drive, and I would like to know why I would need to use the Iomega Guest application, and how to do so.

DISCUSSION -----

Iomega Guest is a utility that allows you to temporarily use a Zip drive on a Macintosh computer without having to install the Iomega Driver in the System Folder. Running Iomega Guest provides the same access to your Zip drive as having the Iomega Driver permanently installed as an extension--it allows you to read files from a Zip disk, write files to a Zip disk, and run the Tools or other software from your Zip disks. The only difference is that when using the Guest program to provide access to your Zip drive, the Iomega Driver does not load automatically each time you start or restart the Macintosh.

Why use Iomega Guest?
=====

There are many reasons to use Iomega Guest:

- * If you want to use a portable Zip drive on multiple computers, but you do not want to install the full Iomega software package.
- * If you want to start your Macintosh computer with the extensions disabled, but you still want access to your Zip drive. This is particularly useful when troubleshooting.
- * If you do not want to install the Iomega Driver permanently in order to reduce the chances of extension conflicts.

How to use Iomega Guest
=====

* To use the Guest program on your own computer, for instance if you have installed Iomega software but are starting your computer with the extensions disabled, simply open the Iomega Tools folder and double-click the Guest icon.

NOTE: You must have the drive connected to the computer before running Guest. Also, the Iomega driver is not installed permanently on a Macintosh computer using this connection method.

Alternative to loading Iomega Guest

=====

An alternative to loading Guest is to simply to have a Macintosh formatted Zip disk inserted when you start your computer. Macintosh-formatted Zip disks contain a driver which will automatically run when the computer starts. To use this simply alternative:

Step 1

Insert a Macintosh formatted Zip disk into the Zip drive.

Step 2

Start the computer following your normal startup procedures.

Step 3

Once your Macintosh has started with the Zip disk inserted, you will be able to use your drive just like any other removeable drive on your system.

NOTE: The Iomega driver is not installed permanently on a Macintosh using this connection method.

Troubleshooting

=====

* The following message may appear when you are attempting to run the Iomega Guest utility, "The driver version 5.0.1 is loaded and ready to run your drive(s)." This message generally indicates that the Iomega Driver is already loaded. Since the Iomega Driver is already loaded, you do not need to use the Iomega Guest utility. In this case, you need only to close the message dialog box and access the Zip drive.

Note: This information comes directly from the online Iomega Guest Help manual, which was included with your Macintosh computer.

Mac OS 7.6: Printer Control Strip Module Dimmed (1/97)

Revised: 1/24/97
Security: Everyone

Mac OS 7.6: Printer Control Strip Module Dimmed (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

I performed a "clean" installation of Mac OS 7.6, selecting all options including QuickDraw GX. I created a desktop printer through the Chooser, but my Control Strip Module Printer Selector is dimmed. Why doesn't it show me the printers I have created and chosen?

DISCUSSION -----

The control strip is for non-QuickDraw GX printers. If you want to use the Control Strip to select and change printers, you must turn off QuickDraw GX and restart your computer. Once you have restarted, you must select your printer using the Chooser. This creates a new desktop printer, which does not use the QuickDraw GX technology. You can use the Control Strip module to change or select this printer.

Note

The QuickDraw GX desktop printer icon, will have an 'X' over it once you disable QuickDraw GX.

Newton OS 2.0: CSTW 2200 Printing Errors with Some Apps (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

I am using a Color StyleWriter 2200 printer with my Newton 2.0 device. Sometimes I get an error when printing stating the Newton device has lost contact with the printer.

DISCUSSION -----

This happens because there is a partial incompatibility between the Color StyleWriter 2200 and printing from some third-party Newton applications. Not all Newton Applications are affected. Apple Computer, Inc. does not currently have a fix for this issue.

QuickTime Conferencing: Can't Upgrade to Apple VideoPhone (1/97)

Revised: 1/24/97
Security: Everyone

QuickTime Conferencing: Can't Upgrade to Apple VideoPhone (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

Our company purchased the QuickTime Conferencing Kit and now would like to upgrade to the Apple VideoPhone software. Where can we get this upgrade? What differences are there between upgrading to Apple VideoPhone Lite and the software purchased with the Apple VideoPhone Kit?

DISCUSSION -----

Apple Media Conference (bundled with the QuickTime Conferencing Kit) has been replaced by Apple VideoPhone as the software used for audio and video conferencing. Currently, there is not an official upgrade for Apple Media Conference, other than downloading Apple VideoPhone Lite from:
[http:// qtc.quicktime.apple.com](http://qtc.quicktime.apple.com).

Apple VideoPhone Lite is essentially the same application as Apple VideoPhone bundled with the Apple VideoPhone Kit. The biggest difference between Apple VideoPhone and Apple VideoPhone Lite is the H.263 video codec (compression/decompression) extension. In addition to the new codec, there are some additional pieces of software including Apple Internet Dialer, Apple Internet Status, and Apple Guide support.

About the H.263 Codec
=====

The H.263 codec improves overall performance and error recovery when using low-bandwidth dial-up connections. However, H.263 may be used over other networking standards to improve performance and reduce network use.

H.263 adds several resolutions in addition to those supported under H.261. Supported resolutions include CIF (352x288) and QCIF (Quarter Common Interchange Format, 176x144) - both part of H.261, as well as SQCIF (Sub-QCIF, 128x96), 4CIF (704x576), and 16CIF (1408x1152) resolutions.

More information on the H.263 ITU Recommendation may be found on the Internet.
The International Telecommunications Union (ITU) website (<http://www.itu.ch>)
provides information on the H.263 standard.

LaserWriter 8.4.x: Type 15 Errors With Desktop Printing (1/97)

Revised: 1/24/97
Security: Everyone

LaserWriter 8.4.x: Type 15 Errors With Desktop Printing (1/97)

=====

Article Created: 24 January 1997

TOPIC -----

When I try to print, I get Type 15 errors when I have Desktop Printing on. I am using the LaserWriter 8.4.x printer drivers.

DISCUSSION -----

I get error type 15's and/or multiple printer icons when printing with LaserWriter 8.4.x with Desk top Printing turned on.

DISCUSSION -----

When you remove or disable the AppleScript and Finder Scripting extension, when Desktop Printing is on, you will either get Type 15 errors, or multiple Desktop Printer icons.

The AppleScript and Finder Scripting extension are used by the LaserWriter 8.4.x and desktop printing software.

How to Correct
=====

Step 1

Force quite the Finder (command-option-escape).

Step 2

Restart with Extension off.

Hold down the Shift key after the startup chime to turn off extensions.

Step 3

Drag all icons with an X to the Trash.

Step 4

Choose Empty Trash from the Special menu.

Step 5

Reinstall AppleScript and Finder Scripting Extensions.

Use your original Mac OS disks or CD disc to reinstall these extensions.

Step 6

Restart your computer.

Mac OS 7.6 and PowerPC Interrupt Extension (1/97)

Revised: 3/19/97
Security: Everyone

Mac OS 7.6 and PowerPC Interrupt Extension (1/97)

=====

Article Created: 25 January 1997

TOPIC -----

Is the PowerPC Interrupt Extension a part of Mac OS 7.6?

DISCUSSION -----

The PowerPC Interrupt Extension is no longer a separate extension in Mac OS 7.6, it is now part of the OS. If the extension is installed on a computer running System 7.5.5, the extension will be removed during the Mac OS 7.6 installation.

V-Twin Information Access Toolkit (1/97)

Revised: 1/25/97
Security: Everyone

V-Twin Information Access Toolkit (1/97)

=====

Article Created: 25 January 1997

TOPIC -----

This article provides a summary of V-Twin and the URL for more information.

DISCUSSION -----

V-Twin is the code name for the information access toolkit developed in the Apple Research Labs (formerly known as ATG). V-Twin provides fast and efficient text indexing and search for use by a variety of applications. Eventually, Apple believes V-Twin will enable a new generation of "content-aware" applications.

Additional information can be found on the internet at the following URL:

<http://www.atg.apple.com/research/tech/V-Twin/default.html>.

PC Compatibility Card: Cannot Share Memory with Mac OS (1/97)

Revised: 1/27/97
Security: Everyone

PC Compatibility Card: Cannot Share Memory with Mac OS (1/97)

=====

Article Created: 27 January 1997

TOPIC -----

Can I share memory on the PC Compatibility Card with the Mac OS, or do I need to add memory to both the PC Compatibility Card and Mac OS computer?

DISCUSSION -----

Unlike the DOS Compatibility Cards, you cannot share memory with the Mac OS on the PC Compatibility Cards. You must add memory to both the PC Compatibility Card and the Mac OS computer.

Mac OS 7.6: No Classic AppleTalk Support (1/97)

Revised: 1/27/97
Security: Everyone

Mac OS 7.6: No Classic AppleTalk Support (1/97)

=====

Article Created: 27 January 1997

TOPIC -----

I installed Mac OS 7.6 and when I run the Network Software Selector a dialog reports, "You have selected Classic AppleTalk for your network services. Classic AppleTalk is not supported on your CPU. Open Transport will be used instead." Does Classic AppleTalk work with Mac OS 7.6?

DISCUSSION -----

Open Transport 1.1.1 is installed as a standard part of Mac OS 7.6 on every system. Classic networking is no longer an option, therefore the Network Software Selector switch is no longer included and will not function properly.

- Tips and Problems

Tips

====

Improving Video Capture

You can increase the speed of video capture by taking one or more of the following actions:

- * Turn off virtual memory in the Memory control panel.
- * Turn off AppleTalk. (You can quickly turn AppleTalk on or off with the Control Strip, or use the Chooser instead.)
- * Reduce the size of the capture window. (160x120 is the best size; also, 320x240 is good.)
- * Do not run programs other than the capture application while capturing video.
- * Turn off the Menubar Clock in the Date & Time control panel.
- * Turn off all unnecessary extensions. Do not turn off QuickTime. (Use the Extensions Manager control panel to turn off extensions; then restart your computer.)
- * Make sure that your hard disk has enough free space to record. If you notice a decline in performance, use a disk optimizer to improve your disk's efficiency.

Using the QuickTake 150 Camera

For best results, use the QuickTake Image Access control panel to look at images in the camera and transfer them to your Macintosh. This method is faster and more reliable than using the PhotoFlash program.

Troubleshooting

=====

IMPORTANT For more troubleshooting information on the problems described below and on other topics, refer to Macintosh Guide (available in the Guide menu when the Finder is active) and the manuals that came with your computer.

Problems Turning on your Computer

When you turn on your computer, a disk icon with a blinking question mark

appears in the middle of the screen. Then after a moment, your computer starts up normally. Your computer is having difficulty locating the startup disk with the system software. (This minor problem can occur if you have reset your parameter RAM.) To correct the problem, do the following:

1. Open the Apple menu and choose Control Panels.
2. Open the Startup Disk control panel.
3. Select your startup disk in the window that appears.
4. Close the Startup Disk control panel window.

Printing Problems

Your system freezes or experiences other problems when printing on a LaserWriter Select 300 or 310 printer. This problem can occur when you attempt to print and your printer is not connected properly to your computer. Trying to cancel printing in the Print Monitor will not solve the problem and may either produce a flashing error message or cause your computer's performance to slow down.

Check to make sure your printer is connected to your computer. If you see a message with a Continue button, click Continue. Normal printing is resumed.

You have trouble printing on a StyleWriter or StyleWriter II printer. Use the StyleWriter 1200 printer driver that came installed on your computer. Do not install your older StyleWriter driver; it is not compatible with PowerPC-based computers.

You have trouble printing with Apple PhotoFlash. Make sure that you have designated a printer in the Chooser. After doing so, open the File menu and choose the Print command.

You can't use the "Print Later" option with a non-networked printer. If you have the Assistant Toolbox extension installed on your computer and you want to use the "Print Later" option when printing on a non-networked printer, you must turn off the Assistant Toolbox extension and restart your computer.

To turn off the Assistant Toolbox extension:

1. Open the Apple menu and choose Control Panels.
2. Open the Extensions Manager control panel.
3. In the list of extensions, click next to the Assistant Toolbox extension to remove the checkmark.
4. Restart your computer.

You see a low-memory warning when you print Stickies on a StyleWriter, StyleWriter II, or StyleWriter 1200 printer. This problem can occur when the amount of memory Stickies uses is set below 150K. Try increasing the amount of memory available to Stickies. For instructions on changing the memory a program uses, refer to Macintosh Guide (available from the Guide menu when the Finder is active).

Performance Problems

You see a message that not enough memory is available. This problem can occur

for several reasons. For detailed tips on memory-related problems, refer to both the troubleshooting information in the manuals that came with your computer, and to the information on memory in Macintosh Guide (available in the Guide menu when the Finder is active).

If this problem occurs after you have opened the Extensions folder in the System Folder and scrolled through a long list of extensions, you can restore normal performance by restarting your computer.

Problems with Sound

When you play back sound you've recorded, you notice clicks, pops, or skips. This problem can occur if you have virtual memory turned on while you're recording sound. Turn off virtual memory before recording. For instructions on turning off virtual memory, refer to Macintosh Guide, available from the Guide menu when the Finder is active.

Adjusting the volume slider in Apple Video Player and other sound applications does not affect the volume, or it turns the volume all the way up or all the way down (allowing no in-between settings). This problem occurs on some newer models that handle sound differently from some older application programs. You can use the system sound settings to adjust the volume. Follow these steps:

1. Open the Apple menu and choose Control Panels.
2. Open the Monitors & Sound control panel.
3. Click the Sound button.
4. Use the volume or level slider (whichever is available) to adjust the sound volume.

Hypercard version 2.3.3 or earlier does not record sound properly on your computer. Other sound recording application programs, including SimpleSound and the Sound control panel, can record sounds that you can import and play within Hypercard 2.3.

Networking and File Sharing Problems

IMPORTANT For information about Open Transport, see the information on networking in Macintosh Guide. For information about networking in general, see the Performa user's manual that came with your computer. Additional information about Open Transport is on your hard disk in a separate folder.

AppleShare displays incorrect information for large drives. If you use File Sharing to share a disk larger than 2 gigabytes (GB), some older computers connected to your computer may display an incorrect size for the disk in the Get Info box. (Get Info reports the disk to be 2 GB in size, even if it is larger.)

Since these older computers do not support the larger drives, they also cannot report correct information about the drives. (Computers with System 7.5 display correct information.)

You can't reconnect to a server. If you unexpectedly lose a connection to a server on which you have items in use, and then choose the server from the Recent Servers item in the Apple menu, you get a message that the disk could not

be opened because you do not have enough access privileges or because the server can't be found on the network. To reconnect to the server:

1. Close any open files. If any of your files contain changes that need to be saved, use the Save As command to save them on an available disk.
2. Choose the server from the Recent Servers item in the Apple menu.
3. If necessary, replace the files on the server with the ones you saved on an available disk when the server was not available.

You see zones and/or servers listed in the Chooser, but the network cable is not connected to the computer. This problem can occur if you disconnect the network cable from the back of your computer while the Chooser is open. Be sure to shut down your computer before disconnecting a network cable.

You have problems using AppleShare Server Software version 4.1 or 4.2. AppleShare server software versions 4.1 and 4.2 are not intended for use with PCI-based computers, such as the Macintosh 5400, 7200, 7500, 8500, and 9500 computers. If you attempt to use AppleShare server software version 4.1 or 4.2 with these models, you may experience problems.

Problems Using a RAM disk

You see a message that your RAM disk is unreadable. Under some circumstances you may see the following message after setting up a RAM disk:

"This disk is unreadable by this Macintosh. Do you want to initialize the disk?"
(Important: This message applies to the RAM disk, not to your hard disk, which will not be initialized.)

Decrease the size of the RAM disk. If you see the message again, decrease the size again. Continue to decrease in small amounts until the message no longer appears.

Problems with Programs Freezing or Quitting Unexpectedly

MoviePlayer quits unexpectedly. Using MoviePlayer 2.1, you can play a movie at double (2X) size. You cannot present a movie (that is, play the movie on a second monitor) at double size. Presenting a movie at 2X size results in the Movie Player quitting without warning.

Wiggleworks freezes, quits unexpectedly, or won't produce sound. Wiggleworks 1.0 requires special software, Macintalk Pro, to produce sound. The version of Macintalk Pro that comes with Wiggleworks is not compatible with your computer. After installing Wiggleworks, you need to drag a newer version of Macintalk Pro (version 1.4 or later) to the Extensions folder (inside your System Folder).

There are two ways to obtain Macintalk Pro version 1.4:

- * Install PlainTalk from the Apple Extras folder. PlainTalk includes Macintalk Pro version 1.4, which is placed in the Extensions folder when you install PlainTalk.

- * Download Macintalk Pro from Apple Computer's America Online or Internet sites.

Refer to the service and support information that came with your computer for information about connecting to Apple's online sites.

If you are unable to obtain Macintalk Pro version 1.4, you can order it from Apple by phone. Refer to the service and support information that came with your computer for the phone number you should call.

Note: Your computer comes with Macintalk 3. Wiggleworks 1.0 does not work with Macintalk 3. To hear sound with Wiggleworks you must have Macintalk Pro version 1.4 in your Extensions folder, but it is not necessary to remove Macintalk 3.

Maple V quits unexpectedly when you change your monitor resolution. This can occur if you use the Control Strip to change the monitor resolution while the Maple V program is active. Use the Monitors & Sound control panel instead of the Control Strip to change screen resolution. For instructions on using the Monitors & Sound control panel, refer to Macintosh Guide (available in the Guide menu when the Finder is active).

When you try to install Adobe Premiere Deluxe, the mouse freezes. This can occur if you have virtual memory turned on and AppleTalk active when you try to install Adobe Premiere Deluxe. Turn off virtual memory and make AppleTalk inactive before installing. For instructions, refer to Macintosh Guide (available from the Guide menu when the Finder is active).

This problem does not occur if you select Adobe Premiere 4.2 installation instead of Adobe Premiere Deluxe.

Problems Using Infrared Features

Farallon AirPath(TM) v1.0 and Apple IR File Exchange don't work on your computer. Also, Farallon AirDock(TM) and other infrared devices are not detected through a serial port that has been selected in the AppleTalk control panel, nor has the string "(IR)" been appended to the port name. Infrared (IR) features are not fully supported on desktop computers running system software version 7.5.3. An AirDock(TM) connected to a selected AppleTalk serial port will, in most cases, operate normally (though forwarding features are disabled). This lets you connect to the desktop system using Personal File Sharing. These problems do not occur on PowerBook computers, and will be corrected on desktop computers in a future update.

Compatibility Problems

===== Ethernet Cards

* The Ethernet CS II Card requires Open Transport software. To use Open Transport, open the Network Software Selector application in the Apple Extras folder, and select Open Transport networking. Then use the AppleTalk and TCP/IP control panels to set up networking with the Ethernet CS II Card. (Do not use the Network and MacTCP control panels.)

* MacIPX is not supported currently by Open Transport and therefore does not work with the Ethernet CS II Card or with any Ethernet PCI card.

* The currently shipping versions of Apple IP Gateway and AppleTalk Internet Router are not compatible with Open Transport.

Japanese and Chinese Language Kits

To use the Japanese Language Kit with your computer, you must install version 1.2 or later. In the United States, you can obtain an upgrade by calling Claris at 1-800-293-6617.

To use the Chinese Language Kit with your computer, make sure you use version 1.1.1 or later. To install the Chinese Language Kit version 1.1.1, follow these three steps:

1. Install the WorldScript Updater 1.0.
2. Install the Chinese Language Kit version 1.0 or 1.1.
3. Install the Chinese Language Kit Updater to update your software to version 1.1.1.

IMPORTANT: Be sure to follow the steps in the order shown.

QuarkXPress

To use QuarkXPress with System 7.5.3 on a PowerPC-based computer, you must upgrade to QuarkXPress version 3.32.

SAM Virus Detection

SAM (Symantec AntiVirus for Macintosh) version 4.0 does not work with System Software version 7.5.3. To use SAM, you must obtain SAM version 4.0.6 or later from Symantec Corporation.

Note: The first time you restart your computer after installing SAM, the screen may be only partially redrawn (with a rectangular area missing) after you dismiss the SAM startup message. This screen problem only occurs once after you install SAM.

STF PowerFax PE

If you use PowerTalk Direct Dialup Mail and have trouble sending a fax, it may be because both Direct Dialup and STF PowerFax PE are set to auto-answer. To turn off STF auto-answer, open the STF Setup window and set 'n' to "never" (in the "Answer on 'n' rings" section).

Important Information About Virtual Memory

=====

Virtual memory (VM) is a feature of the Macintosh that lets you use part of your hard disk as additional memory. If you are using an application program designed especially for PowerPC-based computers (often called a "native" application program), turning on virtual memory lets your application use less memory.

Your computer comes with virtual memory turned off. With virtual memory turned on, a PowerPC-based program uses less memory than when virtual memory is turned off. If you check the program's Get Info box before and after turning on virtual

memory, you'll see that the numbers in the Memory Requirements box change. That is because turning on virtual memory allows the program to use memory more efficiently.

For information on how to turn virtual memory on and off, choose Macintosh Guide from the Guide menu when the Finder is active. Click the Memory topic area, and then click "How do I use hard disk space as memory?" and "Tips for PowerPC-based computers."

For best performance, try setting virtual memory to no more than 150% of the memory (RAM) installed in your computer, or no more than 50% of your currently available hard drive space, whichever number is lower. For example, if your computer has 16 MB of RAM and your hard drive has 50 MB of available space, set virtual memory to a maximum of 24 MB (this is 150% of your 16 MB of RAM, and less than 50% of the available space on your hard drive).

If virtual memory is turned on and you notice performance problems (such as unusually slow computer response) when using certain application programs, you may want to turn off virtual memory.

To improve performance, you can also install more memory (RAM) in your computer. See the Performa user's manual that came with your computer for more information.

Important Information About Document Auto-Save

=====

The Energy Saver control panel contains a feature named "Document Auto-Save." The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Macintosh (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When Document Auto-Save is incompatible with an application, it will either not automatically quit, or it will display alerts or dialog boxes that Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave open no documents that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel so the computer will sleep rather than shut down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Macintosh Guide from the Guide menu when the Finder is active, and choose the Energy Saving topic area.

Other Document-Saving Products

There are conflicts when non-Apple document-saving control panels or extensions are used in conjunction with Energy Saver's Document Auto-Save. Examples of such products are NowSave and SuperBoomerang. For best results, use the document-saving features of only one control panel or extension.

Self-Dismissing Dialogs

Under some rare conditions, the Energy Saver control panel may continuously dismiss dialog boxes if the Document Auto-Save feature unexpectedly fails during an idle or scheduled shutdown. (Whenever a dialog box appears, it is dismissed as if you have pressed the Return key.) To return things to normal, simply click the mouse button or press the space bar.

Important Information About Macintosh PC Exchange

=====

Apple File Exchange and Macintosh PC Exchange

The Apple File Exchange software is not compatible with your Macintosh model. Macintosh PC Exchange provides an easier method for accessing DOS and Apple II ProDOS disks on a MacOS-based computer.

AutoDoubler

To use AutoDoubler with Macintosh PC Exchange, you must first open the AutoDoubler control panel and turn off the "Show DD on Compressed Files" option from the DD menu.

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using Stacker or other DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a MacOS-based computer, you must decompress the files and save them to a noncompressed DOS-format floppy disk.

Working With Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use Macintosh PC Exchange to mount the MacOS-, DOS-, or ProDOS-format partitions as individual volumes on the Macintosh desktop. If the disk contains both MacOS- and DOS-format partitions, Macintosh PC Exchange will recognize only the MacOS partition. In addition, Macintosh PC Exchange will recognize ProDOS-format partitions only on SCSI hard disks that are less than 32 megabytes.

You can use Macintosh PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge if they have the same format. However, you cannot use Macintosh PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a MacOS-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple MacOS, DOS, or ProDOS partitions, you need to use third-party software designed for partitioning hard disks and removable media cartridges.

Working with DOS-Format SCSI Removable Media Devices

In order for Macintosh PC Exchange to recognize any SCSI removable media device, you must turn on the device and eject any cartridges before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the Macintosh PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. Macintosh PC Exchange will install its own device driver for that SCSI device.

The Eject Disk command is unavailable when you are working with removable media devices. To unmount and eject a removable media cartridge, click the device's icon to select it and choose Put Away from the File menu. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply reinsert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on a DOS or DOS-compatible computer, use either the disk setup and partitioning software that came with the SCSI controller card installed in your PC or the one that came with your Bernoulli or SyQuest device. (Do not use the MS-DOS FDISK command.) Also, use the MS-DOS FORMAT command to format a newly initialized removable media cartridge on a DOS or DOS-compatible personal computer (PC) before you copy DOS files onto it.

When you initialize a removable media cartridge on a DOS or DOS-compatible PC, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media drive. If you do not, Macintosh PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Working with DOS-Format SCSI Hard Disk Drives

In order for Macintosh PC Exchange to recognize a SCSI hard disk drive, you must turn on the drive before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the Macintosh PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. Macintosh PC Exchange will install its own device driver for that SCSI device.

When initializing and formatting an external SCSI hard disk connected to a DOS or DOS-compatible PC, use the MS-DOS FDISK command or the disk setup and partitioning software that came with the SCSI controller card installed in your PC. In addition, you should use the MS-DOS FORMAT command to format and erase the disk before you copy DOS files to a new SCSI hard disk connected to a PC.

Tips and Problems

* A "Sad Mac" icon may appear on your screen at startup if a removable media cartridge has been left in the drive. To keep this problem from occurring, manually eject removable media cartridges from their drives before you turn on

your computer.

* Macintosh PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files that contain more than one gigabyte of disk space.

Macintosh Performa 6400/200 Zip: Supported Memory Types (2/97)

Revised: 2/13/97
Security: Everyone

Macintosh Performa 6400/200 Zip: Supported Memory Types (2/97)

Article Created: 27 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains important information about installing memory in some Macintosh Performa 6400 computers.

Note: This information was included in a document included with these computers titled, "Update: New Information About DRAM Installation."

DISCUSSION -----

This update contains information you need to know if you decide to add random access memory (RAM) to your computer. It replaces information about dynamic RAM (DRAM) specifications in the user's manual in the Technical Information booklet for your computer. If you don't need the information immediately, save it with your user's manual so that you'll have it if you ever decide to install additional DRAM in your computer.

Your computer has Extended Data Output (EDO) DRAM Dual Inline Memory Modules (DIMMs), not the fast-paged-mode DIMMs referred to in the user's manual and in the Technical Information booklet for your computer. To take advantage of the faster RAM access time of the EDO DRAM DIMMs already in your computer, DIMMs installed later should be 64-bit wide, 168-pin 5-volt (V) buffered EDO DRAM DIMMs, with 60-nanosecond (ns) RAM access time or faster, and a 1K or 2K refresh count.

Fast-paged-mode will be the default speed, if fast-paged-mode DIMMs are mixed with EDO DIMMS.

Fast-paged-mode DIMMs slower than 60 nanosecond are not recommended.

The Single Inline Memory Modules (SIMMs) from older Macintosh computers are not compatible with your computer and should not be used.

DIMMs that require a 4K refresh count should not be used, either.

Power Macintosh 5500 & 6500: Supported Graphics Modes (4/97)

Revised: 4/28/97
Security: Everyone

Power Macintosh 5500 & 6500: Supported Graphics Modes (4/97)

Article Created: 27 January 1997
Article Reviewed/Updated: 28 April 1997

TOPIC -----

This article contains a description of the video memory and 2D and 3D graphics acceleration support in the Power Macintosh 5500 and 6500 series computers.

DISCUSSION -----

The logic board in the Power Macintosh 5500 and 6500 series computers has the following built-in video and graphics capabilities:

- * ATI 3D RAGE II 64-bit graphics and multimedia accelerator (ATI264GT graphics controller (see description below))
- * 2 MB of synchronous graphic RAM (SGRAM)
- * Hardware acceleration of 2D QuickDraw graphics and video to speed up scrolling text and graphics and screen redraw operations
- * Hardware acceleration of video for full screen, full motion, TV-quality playback of Cinepak and MPEG1 QuickTime movies
- * Bilinear hardware interpolation and scaling
- * Accelerated 3D QuickDraw rendering up to 6 times that of software-only rendering
- * Real-time 3D shaded object manipulation, animation, and virtual world navigation
- * Includes 16-bit Z buffer for hidden texture surface removal
- * Provides six perspectively correct texture-mapping functions
- * Alpha blending, transparency, and fog effects
- * Flat and Gouraud shading
- * Video textures and video lighting

ATI264GT Graphics Controller

=====

The ATI264GT graphics controller contains the logic for the video display. It includes the following functions:

- * Display memory controller, built-in drawing coprocessor, video scaler, color space converter, clock generator, and true color palette video DAC (digital-to-analog converter)
- * Video CLUT (color lookup table)
- * Hardware graphics acceleration with a 16-bit Z-buffer
- * Accelerates QuickDraw 3D rendering up to 6 times that of software-only acceleration
- * True color palette DAC supporting pixel clock rates to 135 MHz for 1280 by 1024 resolution at 75 Hz
- * Graphics and video line buffer for superior video scaling and playback quality
- * Hardware cursor up to 64 x 64 x 2
- * DCC1 and DDC2B plug-and-play monitor support
- * Supports synchronous graphics RAM (SGRAM) at up to 67 MHz memory clock, providing a bandwidth up to 536 MB per second
- * Graphics control accessible through the QuickDraw , QuickDraw 3D, QuickDraw 3D RAVE, and QuickTime components APIs

A separate data bus handles data transfers between the ATI264GT IC and the display memory. The display memory data bus is 64 bits wide, and all data transfers consist of 32 bits at a time. The ATI264GT IC breaks each 64-bit data transfer into several pixels of the appropriate size for the current display mode--4, 8, 16, 24, or 32 bits per pixel.

The ATI264GT IC uses several clocks. Its transactions are synchronized with the PCI bus. Data transfers from the frame-buffer RAM are clocked by the MEM_CLK signal, which runs at 67 MHz. Data transfers to the CLUT and the video output are clocked by the dot clock, which has a different rate for different display monitors.

The 2D graphics accelerator is a fixed-function accelerator for rectangle fill, line draw, polygon fill, panning/scrolling, bit masking, monochrome expansion, and scissoring.

Video Memory & QuickDraw 3D Acceleration

=====

The display memory on the Power Macintosh 5500 and 6500 computers is separate from the main memory. The display memory consists of 2 MB of 12-nanosecond (ns) SGRAM devices configured to make a 64-bit data bus. The display memory cannot be expanded. The display data generated by the computer can have pixel depths of 8, 16, or 32 bits for monitors up to 832 by 624 pixels, 8 or 16 bits for larger monitors up to 1152 by 870 pixels, and 8 bits for monitors supporting 1280 by 1024 pixels. Data from the video input module is always stored and transferred at 16 bits per pixel. The video frame buffers support live video in a 320-by-240 pixel frame at 30 frames per second.

Although the display modes up to 1152 by 870 at 16 bits of resolution are supported, the largest supported display size is useful for standard 2D applications. For 3D applications, the 2 MB of video memory space is used differently, which restricts the useful display size and supported bit depth.

For example, QuickDraw 3D uses double buffering if the hardware supports it. Double buffering immediately reduces the available video memory for application

use. In addition, 3D applications that use a Z buffer for hidden texture removal have even less space available for caching textures to increase graphics rendering speed.

To get the most performance out of 3D applications in the 2 MB of video memory, the display mode size should be reduced. A 512 by 384 display mode is provided specifically for increasing the available memory space for texture caching to improve 3D graphics rendering speed.

Hardware acceleration for 3D applications is not provided for all of the supported 2D display modes. Refer to the tables below for specific information.

AppleShare Print Server 3.0.3 Rev. B: Read Me (1/97)

Revised: 1/27/97
Security: Everyone

AppleShare Print Server 3.0.3 Rev. B: Read Me (1/97)

=====

Article Created: 27 January 1997

TOPIC -----

This article is the AppleShare Print Server 3.0.3 Rev. B ReadMe file.

DISCUSSION -----

This Read Me document provides important information about AppleShare Print Server 3.0.3 Rev. B. You may want to print this Read Me document and keep it with your "AppleShare Server Administrator's Guide."

Using Disk Cache with AppleShare Print Server

Depending on how you use AppleShare Print Server, you may notice an improvement in performance by adjusting the server computer's disk cache size. System 7 is shipped with disk cache on automatically and set to 32K for every megabyte of available RAM. You may wish to experiment with higher settings. (You adjust the cache size in the Memory control panel.)

If you change the size of the disk cache, be sure to restart the server computer after changing the setting for the new size to take effect.

Running AppleShare Print Server with Virtual Memory Turned On

It is possible to run AppleShare Print Server 3.0.3 Rev. B software with virtual memory turned on; however, doing so is not recommended. If you choose to run the software with virtual memory turned on, you will likely notice a decrease in server performance. See the manuals that came with your server computer for more information on using virtual memory.

Problems Fixed in 3.0.3 Rev. B

This version fixes a problem with AppleShare Print Server 3.0, 3.0.1, and 3.0.2. Specifically, printing large graphics files could cause connections to the print server to be dropped prematurely.

Indian Language Kit: Description & Specifications (2/97)

Revised: 2/13/97
Security: Everyone

Indian Language Kit: Description & Specifications (2/97)

Article Created: 28 January 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains the description and technical specifications for the Indian Language Kit.

DISCUSSION -----

The Apple Indian Language Kit is an easy way to add Hindi, Sanskrit, Gujarati, Marathi, Punjabi, and Nepalese text to your documents. It contains the necessary software to work with Devanagari, Gurmukhi, and Gujarati scripts in applications on your Apple Macintosh or other Mac OS-compatible computer.

You can use the Indian Language Kit for a variety of business, educational, and personal projects. It works best with applications that support the Apple WorldScript technology. You can even use it to view ISCII-compatible Indian language sites on the World Wide Web.

After a simple installation process, you can switch effortlessly between the computer's main language and any of the languages supported by this kit, using any application that supports styled text. You can use more than one Indian language in a single document. By installing additional Apple Language Kits, you can also incorporate other languages (such as Japanese, Chinese, and Arabic) in the same document.

The Indian Language Kit includes Apple TrueType fonts that display and print high-quality Devanagari, Gurmukhi, and Gujarati characters at any size. Documents can be printed on both QuickDraw and PostScript printers. If you use a QuickDraw GX application with the kit you will be able to access additional advanced typography features supported by the Apple QuickDraw technology.

The kit comes with a selection of keyboard layouts accompanied by a reference card. The default Inscript layout, developed in India to answer the special

needs of Indian languages, permits all the Indian scripts to be typed in a common way. For users who prefer a phonetic romanized-input option, a QWERTY keyboard layout is also provided for each language.

Features

=====

Versatile multilingual capabilities

- * Install as many language kits as you need on a single Mac OS-based system
- * Switch between languages easily
- * Combine different languages in the same document
- * Take advantage of superior typography features provided by QuickDraw GX applications

Comprehensive, high-quality fonts

- * Three Apple TrueType fonts for high-quality on-screen and printed characters
- * Support for QuickDraw and PostScript printers
- * Full compatibility with QuickDraw GX technology

Ease of use

- * Simple, customizable installation process
- * Choice of keyboard layouts for easy text entry
- * Keyboard quick-reference card

Compatibility

- * Supports the Inscript keyboard layout for Indian text entry
- * Supports the ISCII (Indian Script Code for Information Interchange) standard defined by the Bureau of Indian Standards (IS 13194 : 1991)
- * Is compatible with any localized version of the Mac OS (version 7.5 or later) and with other Apple Language Kits
- * Works with Apple's WorldScript technology

Technical Specifications

=====

TrueType fonts

- * Devanagari MT
- * Gurmukhi MT
- * Gujarati MT

Keyboard layouts

- * Devanagari (Inscript)
- * Devanagari (QWERTY)
- * Devanagari/Nepali
- * Gurmukhi (Inscript)
- * Gurmukhi (QWERTY)
- * Gujarati (Inscript)

* Gujarati (QWERTY)

Extras (accessory software)

* Devanagari Shikshak 1.0 (a typing tutor to learn the INSCRIPT keyboard)
* Hindi Learning Stack 1.0 (a HyperCard program to get started learning the Devanagari alphabet)

Application compatibility

The Indian Language Kit is based on the Apple WorldScript technology, and works best with applications that take advantage of WorldScript.

These programs include:

* HyperCard from Apple Computer
* LightningDraw GX from Lari Software
* ReadySetGo! GX from Modular Software
* Nisus Writer from Nisus Software
* PhotoShop ME from Adobe Systems
* WorldWrite from World Software

Note: Apple has tested only a limited number of applications, therefore this list is not intended to be comprehensive. Many applications that do not employ WorldScript software technology may provide limited functionality and allow input of Indian characters.

Standards support

* Supports the Indian Script Codr for Information Interchange (ISCII) standard defined by the Bureau of India Standards (13194:1991).

System requirements

* An Apple Macintosh, Power Macintosh, PowerBook, or other Mac OS-compatible system
* 5 MB of RAM
* Mac OS version 7.5 or later
* An Apple SuperDrive floppy disk drive or a CD-ROM drive (CD-ROM drive required to access certain accessory software; see Ordering Information)
* One or more applications that support WorldScript technology
* To take advantage of the kit's QuickDraw GX features, QuickDraw GX software and one or more applications that use QuickDraw GX features

Ordering Information

=====

Indian Language Kit

Order No. 440000U

* 1.4MB floppy disks and one CD-ROM containing:
- Indian Language Kit software
- SimpleText software
- Extras (on CD-ROM only)
- LaserWriter driver software (on CD-ROM only)
* Indian Language Kit User's Manual

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

AppleShare Workstation 3.6.5 Read Me (1/97)

Revised: 1/28/97
Security: Everyone

AppleShare Workstation 3.6.5 Read Me (1/97)

Article Created: 28 January 1997

TOPIC -----

This article is the AppleShare Workstation 3.6.5 ReadMe file.

DISCUSSION -----

Contents

Changes from AppleShare Workstation 3.6.2
Changes from AppleShare Workstation 3.6.3 & 3.6.4
System Software recommendations

Changes from AppleShare Workstation 3.6.2

• AppleShare Workstation 3.6.2 was modified to allowed the user to change his or her password during alias resolution. This modification caused two problems:

- Utilities (such as virus-protection utilities) that patch GetResource could cause AppleShare Workstation software to crash when opening an alias that required a password.
- The system could hang if a background application performed file I/O while an alias that required a password was being opened.

For AppleShare Workstation 3.6.3, this modification was removed. It will be re-implemented in a future version of AppleShare Workstation software.

• A conflict with applications that quit the Finder, notably the Apple Installer, was fixed.

Changes from AppleShare Workstation 3.6.3 & 3.6.4

• AppleShare Workstation 3.6.3 and 3.6.4 differ only in the bundle bit being set on the

AppleShare extension.

- AppleShare Workstation 3.6.5 fixes some internal version strings that were not updated with 3.6.4.

System Software recommendations

- Computers running system software prior to 7.5.1 should run AppleShare Workstation 3.5.
- Computers running system software 7.5.1 or later should run AppleShare Workstation 3.6.5.

Network Server 500 or 700: Configure PPP Server in AIX (1/97)

Revised: 1/28/97
Security: Everyone

Network Server 500 or 700: Configure PPP Server in AIX (1/97)

=====

Article Created: 28 January 1997

TOPIC -----

This article describes configuring a simple PPP Server in AIX 4.1.4 on an Apple Network Server 500, or 700.

DISCUSSION -----

To configure a simple PPP Server on an Apple Network Server 500 or 700 running AIX 4.1.4, follow the steps below:

Step 1

Create a tty for your serial port with login enabled, rts or cts flow control, and a serial port rate at 38400 for modem that are over 14400 kbps. Use smitty devices or type this shell command:

```
mkdev -c tty -t 'tty' -s 'rs232' -p 'sa0'
```

This command will create the tty on serial port 1.

Step 2

Add this line in your Devices file in the "/etc/uucp" directory.

Direct tty0 - any direct

Be sure to save the file with the "w!" in vi because the file is read only and then exit with "wq" when finished.

Step 3

Type smitty ppp and go to link control configuration, go to add a link configuration.

```
1 server
0 client
0 demand ( available only on AIX 4.2)
1 interface
1 hdlc
```

Leave the rest at default values.

Step 4

Go to smitty addpppserver

- a) fill in local address (your local system IP address)
- b) starting remote address (your remote address for the peer)
- c) number of addresses (1)

Step 5

Start the PPP subsystem through smitty or type

```
/etc/ppp/mkppp -start 'both'
```

Step 6

When you login, the .profile should contain:

```
exec /usr/sbin/pppattachd server
```

LaserWriter Select Series: Printing Light on Half of Page 1/97

Revised: 1/28/97
Security: Everyone

LaserWriter Select Series: Printing Light on Half of Page 1/97

=====

Article Created: 28 January 1997

TOPIC -----

I have a LaserWriter Select 360 printer, which is printing light on one-half of the page. I replaced the toner cartridge, but that did not correct the light printing.

DISCUSSION -----

On the LaserWriter Select 300, LaserWriter Select 310, and LaserWriter Select 360 printers this problem can occur when there is a build-up of toner on the glass inside the printer.

The laser beam passes through a window in the printer chassis before striking the photosensitive drum within the toner cartridge. The window is in a long narrow slit directly behind the toner cartridge. If toner build-up occurs on this window, printouts exhibit a faded inconsistent look, similar to the appearance of a toner cartridge at the end of its life. The faded appearance is often more pronounced on the left side of the page.

How to Correct Image Fading

=====

Step 1

Remove the toner cartridge.

Step 2

Wipe the front surface of the glass with a lint free cloth.

Step 3

Replace the toner cartridge.

Step 4

Print a startup page.

If the print quality does not change, the problem is not with the window.

Step 5

Replace the toner cartridge with a known good cartridge.

If the problem does not go away, your printer needs to be examined by an Apple service technician.

PC Compatibility Card and IMS Video (1/97)

Revised: 1/29/97
Security: Everyone

PC Compatibility Card and IMS Video (1/97)

=====

Article Created: 29 January 1997

TOPIC -----

I have a Power Macintosh 7200/120 with a PC Compatibility card and an IMS Twin Turbo Video card installed. If I am using built-in video, the PC Setup control panel allows for configuration of my 20-inch display. If I am using the IMS video card, the PC Setup control panel only allows configuration of a 640 x 480 display. What could be causing this?

DISCUSSION -----

When a PC Compatibility card is present, the correct video driver to use with the IMS Twin Turbo video card is version 3.6. Older versions of the driver may not provide full functionality for the display you are using.

Performa 6400/6360 & GeoPort Modem: Data/Fax Arbitration (1/97)

Revised: 1/31/97
Security: Everyone

Performa 6400/6360 & GeoPort Modem: Data/Fax Arbitration (1/97)

Article Created: 30 January 1997

TOPIC -----

I cannot get the data/fax arbitration to work correctly on a Macintosh Performa 6400 or 6360 with a GeoPort modem. What should I do?

DISCUSSION -----

1. Open the Express Modem control panel and verify the Express Modem is turned on.
2. From the General Settings pop-up menu, choose "Advanced Options." Make sure that unknown calls are selected to be transferred to the Voice application.
3. Open AppleFax and verify that the Receive Faxes option is in the ON position.
4. Open Megaphone and choose Preferences from the File menu.
5. From the Topics pop-up menu, choose Mailboxes. Ensure that "Allow Megaphone Voice Messaging" is enabled.
6. From the Topics pop-up menu, choose Incoming Calls. Ensure that "Come to Front When Ringing" is chosen.

This should suffice to allow the computer to automatically arbitrate between fax and voice calls.

Note that Megaphone must always be open for this feature to work.

If the above steps did not resolve your issue, you may have a software conflict. Please review the Tech Info Library articles listed below. They provide general guidance on how to troubleshoot extension conflicts.

Note that certain types of third-party performance enhancement utilities which

modify the system at a low level can modify system performance enough that some features may not work correctly.

Newton 2.x OS: Known Windows Serial Connection Issues (1/97)

Article Created: 30 January 1997

TOPIC -----

This article provides information on known Windows serial connection issues.

DISCUSSION -----

On some Windows-based computers, customers with Newton OS 2.x units may experience serial connection problems with the Newton Backup Utility for Windows 1.0 and the Newton Package Installer 2.0. Users may experience the following symptoms:

Newton Backup Utility for Windows 1.0

- * does not establish a connection to the unit
- * drops connections to the unit
- * completes backs up but does not create the backup file
- * will not install a package onto a storage card
- * experiences random serial connection failures

Newton Package Installer 2.0

- * does not establish a connection to the unit
- * drops connections to the unit
- * will not install a package onto a storage card
- * experiences random serial connection failures

Products with Revised Serial Driver

The following products incorporate a revised serial driver in the Windows host software that do not exhibit these symptoms

- * Newton Backup Utility for Windows 1.0.1

- * Newton Press for Windows 1.0

- * Newton Connection Utilities for Windows 1.0 (This product is currently a beta product and not supported by Apple's support staff).

Also, the following products are intended for Newton 1.x units and are not affected by this issue

- * Newton Connection Kit for Windows 1.x and 2.x

- * Newton Package Installer for Windows 1.1

Mac OS 7.6 and Connectix Speed Doubler Issue (1/97)

Revised: 1/30/97
Security: Everyone

Mac OS 7.6 and Connectix Speed Doubler Issue (1/97)

=====

Article Created: 30 January 1997

TOPIC -----

This article describes an issue between Mac OS 7.6 and Connectix Speed Doubler.

DISCUSSION -----

Some versions of Connectix Speed Doubler are not compatible with Mac OS 7.6. If you are using Speed Doubler version 1.3.1 or earlier, you should update to version 1.3.2. If you are using version 2.0, you should update to version 2.0.1. You should disable Speed Doubler until you can update your Speed Doubler software. Speed Doubler Updaters and more information on this problem are available from Connectix on the World Wide Web at:

<http://www.connectix.com/connect/upda.spee.html>

You may also call Connectix at 800-839-3632 for more information, or if you have any additional questions.

Mac OS 7.6: Netscape Navigator Freezes (1/97)

Revised: 3/19/97
Security: Everyone

Mac OS 7.6: Netscape Navigator Freezes (1/97)

=====

Article Created: 30 January 1997

TOPIC -----

This article describes a situation where Netscape Navigator may fail with Mac OS 7.6 if the Shared Library Manager extension is turned off by the Extensions Manager control panel.

DISCUSSION -----

The Shared Library Manager extension is needed on PowerPC processor-based computers, and when this extension is turned off, Netscape Navigator v3.0 freezes after it attempts to access a URL (uniform resource locator). Occasionally, Netscape will load a URL or two and freeze within the next minute or so.

Also, the description in Extensions Manager control panel, in the Item Information section, of the Shared Library Manager is not correct. This description incorrectly states, "... Needed if your computer is using Open Transport and has a 68020, 68030, or 68040 processor."

The two extensions, Shared Library Manager PPC and Shared Library Manager, are both needed for a PowerPC processor-based Mac OS computer.

This article appeared in the 31 January 1997 issue of the Information Alley.

Apple MessagePad: Finding Windows Serial 9600 driver (1/97)

=====

Article Created: 31 January 1997

TOPIC -----

I removed the Serial 9600 driver from my Newton 2.x OS device, and did not have a backup of my data. I would like to reinstall the Serial 9600 driver. Where can I get this driver it?

DISCUSSION -----

The Serial 9600 driver is not available separately. However, it is included in the following products listed below, which are available on the Apple Software Updates sections online.

+=====+	
Product name	Online Filename
+=====+	
Newton Backup Utility 1.0.1	NBU101EN.ZIP

MegaPhone: Type 11 Error With GeoPort Software (2/97)

Revised: 2/3/97
Security: Everyone

MegaPhone: Type 11 Error With GeoPort Software (2/97)

=====

Article Created: 3 February 1997

TOPIC -----

If the Telephone Manager is turned off on a Macintosh Performa computer which has an internal GeoPort modem, Megaphone fails with a type 11 error when it is launched. Why?

DISCUSSION -----

This issue is unique to the GeoPort software. When a Macintosh Performa 6400/200 computer with the Global Village software was tested, the dialog states that the Telephone Lib file could not be found, and exits from the application.

Cypress Research has been notified and they will fix it in an upcoming version of MegaPhone.

Newton Connct Kit for Windows: Limited Windows 95 Support (1/97)

Revised: 1/31/97
Security: Everyone

Newton Connct Kit for Windows: Limited Windows 95 Support (1/97)

=====

Article Created: 31 January 1997

TOPIC -----

Is the Newton Connection Kit for Windows supported under Windows 95?

DISCUSSION -----

The Newton Connection Kit for Windows was originally written for Windows 3.1x, and it was only tested under Windows 3.1x. Although it has not been qualified for use under Windows 95, informal usage indicates that it functions properly.

Although it is not officially supported under Windows 95, Apple recommends customers run Newton Connection Kit for Windows 2.0.3, which is the latest version of this software.

Pwr Mac 6360/Performa 6400: Pulse Dialing Does Not Work (3/97)

=====

Article Created: 31 January 1997
Article Reviewed/Updated: 3 March 1997

TOPIC -----

I cannot use pulse dialing to fax from the Apple Telecom software. It always defaults to tone dialing.

DISCUSSION -----

Apple is aware of the issue. However, at this time there are no known workarounds, and there is no date estimates when this will be corrected in the Telecom software.

Apple Telecom 3.1: Fax Sender GX sends Reduced Size Fax (2/97)

Revised: 2/3/97
Security: Everyone

Apple Telecom 3.1: Fax Sender GX sends Reduced Size Fax (2/97)

=====

Article Created: 3 February 1997

TOPIC -----

I have a Macintosh Performa 6360 and a Macintosh Performa 6400 with the internal GeoPort modem. I have updated my Apple Telecom software with the 3.1.1 updater from Apple's Software Updates web site, and installed QuickDraw GX 1.1.5. Now when I send a fax from some of my word processing applications using Fax Sender GX, I notice that the faxed pages are reduced to about 20% of their actual size. How can I correct this?

DISCUSSION -----

Some word processing applications do not support QuickDraw GX. Fax Sender GX (part of Apple Telecom 3.1) allows you to fax from QuickDraw GX-savvy applications when QuickDraw GX is installed. Applications that support QuickDraw GX do not experience this reduction problem when printing through Fax Sender GX.

In order to avoid this reduction problem, you can temporarily disable QuickDraw GX by disabling the QuickDraw GX extension using the Extensions Manager control panel. After restarting your computer, you can select the regular Fax Sender driver in the Chooser and fax normally.

LW 8.4.x: Type 11 Error When Setup Used With ATM 4.0 (2/97)

Revised: 2/4/97
Security: Everyone

LW 8.4.x: Type 11 Error When Setup Used With ATM 4.0 (2/97)

Article Created: 4 February 1997

TOPIC -----

I am using the LaserWriter 8.4.1 printer software and just installed Adobe Type Manger (ATM) 4.0. Now when I select the LaserWriter icon and select Setup, I either get a Type 11 error or my computer "freezes".

DISCUSSION -----

This can occur with any combination of LaserWriter 8.4.x and ATM 4.0 when setting up a printer for the first time. Once a LaserWriter has gone through Setup in Chooser, successive Setups of that printer work properly.

This issue should be resolved in a future version of the LaserWriter driver software. Until then, you can use one of the workarounds listed below.

Workarounds

- Disable ATM 4.0 before setting up a LaserWriter for the first time in Chooser.
- Use the LaserWriter 8.3.4 software. Versions of the LaserWriter driver earlier than 8.4 do not exhibit this issue.
- Use LaserWriter 8.4.2. Although susceptible to this issue, results are better when using the LaserWriter 8.4.2 with ATM 4.0 software.

Performa 6400: Location of GeoPort AT Modem Commands (2/97)

Revised: 2/4/97
Security: Everyone

Performa 6400: Location of GeoPort AT Modem Commands (2/97)

=====

Article Created: 04 February 1997

TOPIC -----

I have purchased a Macintosh Performa 6360 with the internal GeoPort modem. After checking through all of the Read Me documents and hard copy documentation, I cannot locate the AT modem command set references. Where can I find this information?

DISCUSSION -----

Performa 6360 and 6400 computers shipped without an AT Command Set reference booklet. This command set is available on Apple Software Updates as part of the "Geoport-EM 3.1.1 Update" disk set. Macintosh Performa 6360/6400 users are encouraged to update their software to this version or later. After installing the update, you will find to reference booklet in the "Telecom Documents" folder on your hard disk. This document is called "AT Command Set (US) 33.6.pdf". This document is in the Adobe Acrobat PDF file format.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Mac OS Up-To-Date: Information With Order Form (4/97)

Revised: 4/16/97
Security: Everyone

Mac OS Up-To-Date: Information With Order Form (4/97)

Article Created: 4 February 1997
Article Reviewed/Updated: 16 April 1997

TOPIC -----

This article contains the information in the Mac OS Up-To-Date order form, however, this article does not include the order form itself. Fulfillment coupons and more information are available through the following means:

- Telephone
 - Mac OS Up-to-Date Customer Service 1 (800) 335-9258
(7 a.m. - 8 p.m. Mountain time)
- AppleFax at 1 (800) 462-4396
 - document no. 11438 (fulfillment coupon)
 - document no. 11437 (list of qualifying computers)
- Worldwide Web
 - <http://www.macos.apple.com/macos/releases.html>

DISCUSSION -----

Apple Computer and the participating Mac OS licensees have created the Mac OS Up-To-Date program for customers who purchase a qualifying new Mac OS computer that does not have the latest version of the Mac OS installed. This program allows them to upgrade to the latest version of the Mac OS for \$9.95 U.S. Dollars (USD).^{*} Just complete and send in this order form, along with a copy of your dated itemized sales receipt. See "Terms and Conditions" for program details. Your order must be postmarked or faxed within 180 days of your purchase, so order your upgrade now!

^{*} U.S. customers add appropriate state sales tax; Canadian customers add 7% sales tax.

Terms and Conditions

-
- This program begins by offering Mac OS 7.6 (U.S. English version only) to customers who purchase a qualifying computer on or after December 7, 1996. Mac OS updates, which may currently be downloaded from Apple World Wide Web sites, are not included in this program. Future Mac OS releases may be provided through this program; however, Apple reserves the right to change or discontinue this program at any time.
 - This offer is good only in the U.S. (50 states and the District of Columbia) and Canada, and valid only in accordance with the terms set forth on this certificate.
 - Void where prohibited by law, or where restricted.
 - This offer is available only with the purchase of a qualifying Mac OS computer. See "Qualifying Computers" for information on how to determine if your model qualifies.
 - This program entitles the purchaser to the latest retail U.S. English version of the Mac OS that was publicly available from Apple Computer at the time of purchase, or that was released within 30 days after purchase.
 - To receive your upgrade, you must complete the applicable order form and provide a photocopy of a dated, itemized invoice or packing slip indicating the model number(s) of the system(s) purchased. Completed order form, payment, and dated proof of purchase must be postmarked or faxed within 180 days of purchase; send to the address or fax number listed on order form.
 - Allow 6 to 12 weeks for delivery via UPS or First Class Mail.
 - Lost, late, or misdirected mail, and fax errors are not the responsibility of Apple Computer or The Hibbert Group.
 - Keep a copy of the Terms and Conditions as well as your completed order form for your records.
 - Every effort has been made to ensure that the information in this order form is accurate. Apple is not responsible for printing errors.
 - Apple reserves the right to change the Terms and Conditions of this offer at any time without notice.
 - No refunds or returns will be allowed in this program.
 - This offer is not valid in conjunction with any other Mac OS offer.
 - This offer is limited to one CD upgrade kit per qualifying computer purchased.
 - If any computer in your order does not qualify, your entire order will be returned to you along with any payment you provided.

Qualifying Computers

A Mac OS-compatible computer qualifies for this program if it was sold by Apple Computer, Inc., or a participating licensed manufacturer of Mac OS-compatible computers and either did not include the version of the Mac OS that was current at the time of purchase or a new release of the Mac OS was made available by Apple Computer within 30 days after purchase. The combination of your date of purchase and the computer model number is used to determine whether your order qualifies for this program. See below for an example of a model number. Visit the Mac OS Up-To-Date web site at <http://www.macos.apple.com/macos/releases/fulfillment.html> for more information, including how to determine your computer's model number.

Multiple Qualifying Computers on a Single Invoice

If you purchase multiple qualifying systems on a single invoice, you may either (1) purchase a Single-User CD Upgrade Kit for each qualifying system, at a cost of \$24.00 each plus appropriate sales tax;* or (2) purchase fewer Single-User CD Upgrade Kits and request the Right to Copy for the remaining qualifying systems. For example, if you purchased 11 qualifying systems on a single invoice, you might choose to purchase 2 Single-User Upgrade Kits at a total cost of \$48.00 plus applicable sales tax* and request the Right to Copy for the remaining 9 qualifying systems.

Performa 6360/6400: Apple Fax & Cover Page Problems (2/97)

Revised: 2/4/97
Security: Everyone

Performa 6360/6400: Apple Fax & Cover Page Problems (2/97)

Article Created: 4 February 1997

TOPIC -----

I have a Performa 6360 & 6400 with an internal Geoportmodem installed. I am using the Apple Fax software that is included with my Performa to send faxes from various applications. I have updated my software using the Apple Telecom 3.1.1 Updater.

I have noticed some errors with the Sample, Standard and Homemade cover pages. Some of the text in the <Recipient Name> field is either missing or showing in the wrong place within the field on the imaged or sent fax. Specifically, the zip code appears after the street name and the state does not appear at all. Also, when using the calling card feature, I notice that my calling card number appears in the <Recipient Fax Number> field on the imaged or sent fax.

Are there any known workarounds for these issues? Will this be investigated?

DISCUSSION -----

Apple is aware of these issues with the fax Cover Pages and is working to correct them in a future release of Apple Telecom software.

At this time, there are no known workarounds for the zip code appearing in the wrong place and state not appearing at all in the <Recipient Name> field. For the issue with the calling card being printed in the <Recipient Fax Number> field, users can open the cover page using the Apple Fax application and delete the <Recipient Fax Number> field entirely.

Modified fax cover sheets with the <Recipient Fax Number> field deleted are available through Apple Software Update sites.

The latest version of the Apple Telecom updater software is version 3.1.1. It is available through all Apple Software Update sites.

These articles can help you locate the software updates mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Optical Access CD Tower: Can't Use Apple CD Extension (2/97)

Revised: 2/5/97
Security: Everyone

Optical Access CD Tower: Can't Use Apple CD Extension (2/97)

=====

Article Created: 5 February 1997

TOPIC -----

I recently updated the Mac OS software on my Apple Workgroup Server 6150 computer, and now CD-ROM discs placed in the Optical Access CD-ROM Tower are not recognized. Why?

DISCUSSION -----

The Optical Access CD/Maxtete 4X CD-ROM Tower from Optical Access International requires its own software to work properly. Apple included the Optical Access CD-ROM Tower as part of the Library Research server bundle.

The Workgroup Server 6150 shipped with the Apple CD-ROM extension disabled and the proper software installed. Whenever you reinstall or upgrade the Mac OS, the Apple CD-ROM extension is enabled. This allows you to use the internal CD-ROM drive in the Apple Workgroup Server 6150, but since the Apple CD-ROM extension loads before the Optical Access CD-ROM software you cannot use the Optical Access CD/Maxtete 4X CD-ROM Tower.

Note:

If you start your computer with a Mac OS system software CD-ROM disc in the internal Workgroup Server drive, you will not be able to use the CD-ROM tower since its software does not load off the system software disc.

Turning Off Apple CD-ROM Extension

=====

Step 1

Open the Extensions Manager control panel.

Step 2

Locate the Apple CD-ROM extension.

Step 3

Click on the Apple CD-ROM extension to disable it.

Note:

Depending on which version of the Mac OS is installed this step varies slightly. You will either have a check next to the extension indicating it is active, or an 'x' indicating it is active. Make sure either the check mark or 'x' is removed next to the Apple CD-ROM extension.

Step 4

Close the Extension Manager control panel.

Step 5

Restart your computer.

You can use your Optical Access CD Tower. However, will not be able to use the internal Workgroup Server CD-ROM drive.

If you need additional help with the Optical Access CD Tower, contact Optical Access International.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

AppleFax: Can't Print Legal-Sized Fax Documents (2/97)

=====

Article Created: 5 February 1997

TOPIC -----

I have a legal-sized fax that I received using AppleFax. When I print it, it is truncated, and I cannot view the entire fax, even if I use legal-sized paper. How can I print the entire fax?

Note:
Apple Fax is installed as part of the Apple Telecom Software.

DISCUSSION -----

This issue is currently being investigated by Apple Computer Inc. Until a permanent solution is found, you can use one of the workarounds listed below.

Workarounds
=====

Change the Scale

Step 1

Choose Page Setup from the File Menu.

Step 2

Change the Scale to 80 percent.

Step 3

Click OK.

Step 4

Print the fax.

Save as a PICT

Step 1

Choose Save AS from the File Menu.

Step 2

Save the fax as a PICT file.

Step 3

Print the document using SimpleText.

CD Control Strip: Isn't Installed w/ Clean Install (2/97)

=====

Article Created: 5 February 1997

TOPIC -----

I just did a clean install of 7.5.3 on my PowerBook 1400 and noticed that the CD Strip was not installed. I performed a complete install and it still is not there. How can I get it back?

DISCUSSION -----

The CD Strip is on the PowerBook 1400 CD-ROM System Software disc. It is located in the Install Apple Extras folder. You can install the CD Strip module by dragging it to the Control Strip Modules folder, which is located inside the System folder.

LaserWriter 12/640 PS: Configuring TCP/IP for Text or PCL (2/97)

Revised: 2/5/97
Security: Everyone

LaserWriter 12/640 PS: Configuring TCP/IP for Text or PCL (2/97)

Article Created: 5 February 1997

TOPIC -----

I am trying to print a PCL file to my LaserWriter 12/640 PS printer from my UNIX workstation. Every time I try, it does not print the file correctly. I can print PostScript files correctly. Why?

DISCUSSION -----

When Apple Computer shipped the LaserWriter 12/640 PS printer, the TCP/IP port interpreter was set for PostScript only. You need to change this to either PCL or Autoselect.

Determining TCP/IP Configuration

Step 1

Print a startup page.

Step 2

Look at the upper right corner for the TCP/IP field.

The TCP/IP field has the interpreter's setting.

Changing the TCP/IP Configuration

=====

If the LaserWriter 12/640 PS printer has either a Mac OS or Windows computer attached, you can use the Apple Printer Utility (Mac OS), or LaserWriter Utility for Windows software to change the interpreter to either Autoselect or PCL.

If you do not have a Mac OS or Windows computer connected to the LaserWriter 12/640 PS, follow these steps to set the printer to autoselect:

Step 1

Configure your UNIX workstation to print PostScript as described in its manual.

Step 2

Ensure the LaserWriter 12/640 PS communication switch is depressed (this is the normal setting).

Step 3

Change the setting using PostScript. Below is PostScript code to the printer to change the settings.

```
%=====
% Begin PostScript code
%
%!PS
(%LPR_NV%) <</Interpreter /AutoSelect >> setdevparams
%
% End PostScript code
%=====
```

Step 4

Restart the printer.

Resetting the LaserWriter 12/640 PS to PostScript Only

To reset the printer to PostScript only, follow these steps

Step 1

Press and hold the communications switch, so it is in the up position.

Step 2

Restart the printer.

Step 3

Release the communications switch.

The LaserWriter 12/640 PS TCP/IP port is now set to PostScript.

LaserWriter 8.4.x: Doesn't Support Custom Page Sizes (2/97)

Revised: 2/5/97
Security: Everyone

LaserWriter 8.4.x: Doesn't Support Custom Page Sizes (2/97)

=====

Article Created: 5 February 1997

TOPIC -----

After upgrading to LaserWriter 8.4.x from LaserWriter 8.3.4, I can no longer select a custom page size in my Page Setup dialog. I am printing to an imagesetter which supports various paper sizes, and have been able to input custom page sizes with prior versions of the LaserWriter 8 printer driver. What is wrong?

DISCUSSION -----

As of LaserWriter 8.4, support for custom page sizes was removed from the LaserWriter 8 printer driver. This feature was not implemented well, so it was removed. There are plans to incorporate custom page sizes again in later releases of the LaserWriter 8 printer driver using a new and improved user interface.

Workarounds

=====

- Use the Adobe PS Printer driver
- Use the LaserWriter 8.3.4 printer driver.

Article Created: 5 February 1997

TOPIC -----

This article describes an issue when a dialog informs a user that they have defective hardware.

DISCUSSION -----

Mac OS 7.6, because Open Transport is required, has a "sniffer routine" which checks for the presence of defective L2 cache. If defective hardware is discovered, a dialog is displayed informing the user that a hardware issue was detected and repairs are necessary. The required repairs are covered under the Apple Repair Extension Program.

For more information see Technical Information Library article, "Macintosh 5200/5300/6200/6300: Using Open Transport".

PowerBook: Modem/Ethernet PC Card Not Recognized (2/97)

Revised: 2/5/97
Security: Everyone

PowerBook: Modem/Ethernet PC Card Not Recognized (2/97)

=====

Article created: 5 February 1997

TOPIC -----

I just did a clean install of my system software and now when I insert my Global Village Platinum Pro modem/Ethernet PC card, I get the following message.

"The correct software you need to use the PC Card in the Lower PC Card slot is not installed. Do you want to eject the card now?"

I thought that the system software came with the necessary software to recognize modem cards. Why am I getting this message?

DISCUSSION -----

The system software does include software which enables it to use standard Type II modem cards. However, the Global Village Platinum Pro and other "combo" cards need additional software to be recognizable by the PowerBook computer.

"Combo" or combination cards include cards that have functionality in addition to being a modem, such as Ethernet. These cards require additional software to be recognized by the computer even if you are just using the modem and not using the Ethernet or other capabilities. In addition to Global Village, some examples of the other vendors making these types of cards are Farallon, Dayna and Asante.

To resolve this situation, you simply need to install the software that came with your PC card. After you install the necessary software the card should be functional again.

This article was published in the Information Alley on 5 February 1997.

TITLE

Macintosh Infrared: Is It IrDA Compatible?

Article ID: 20928
Created: 2/6/97
Modified: 6/16/99

TOPIC

Does the built-in infrared technology used in the PowerBook 190, 1400, 2400, 3400, 5300, PowerBook G3 and G3 Series, and iMac support the IrDA (Infrared Data Association) standard? If so, can I use them to communicate with my Newton MessagePad or other IrDA device?

DISCUSSION

PowerBook 190, 5300, and 1400

The PowerBook 190, 5300, and 1400 series computers are not IrDA-compliant. Hence, these computers will not work with third-party devices which are IrDA compliant, such as some of Apple's MessagePad devices and some Hewlett Packard printers. Instead, these products use a protocol named IRTalk.

The infrared implementation used in these PowerBook computers is designed to share information with other infrared-equipped PowerBook computers and the Farallon Air Dock (a wireless LocalTalk file sharing solution). The Apple IR File Exchange transfer rate is 230.4kbs, the same as LocalTalk.

PowerBook 3400, PB 2400, and PowerBook G3 and G3 Series

The PowerBook 2400, 3400, G3 and G3 Series computers are IrDA compliant. Additionally, they have the option to switch to the IRTalk protocol via the Infrared Control Panel. These computers can communicate with other IRTalk-capable devices (such as other PowerBook computers), using either the IrDA or IRTalk protocol.

Note: PowerBook G3 Series computers support IrDA 1.1 with speeds up to 4 Mbps.

While the PowerBook 2400, 3400, G3 and G3 Series computers have the hardware necessary to communicate with other IrDA compliant devices such as the Apple eMate 300 or the Newton MessagePad 2000, at this time Apple does not have a software solution to communicate with them.

For information about whether the 2400, 3400, G3 and G3 Series computers can communicate with other IrDA compliant devices, contact the manufacturer of the device.

iMac

There are several versions of the iMac computer. The first two versions (referred to as revision A and revision B) were colored Bondi Blue. The next version (referred to as revision C) was introduced in January 1999 and came in five different colors.

Revision A and B iMac computers support IrDA, but not IRTalk. Revision C iMac computers do not support infrared communication of any type.

For additional information see the following articles:

- Tech Info Library Article 30707: "[Macintosh: Printing to a PostScript Printer via IrDA](#)"
- Tech Info Library Article 30861: "[PowerBook: Printing to an IrDA Printer](#)"
- Tech Info Library Article 58012: "[iMac: Infrared Communications](#)"

For general information on IrDA, see <http://www.irda.org>

PowerBook G3 Series (Bronze Keyboard)

PowerBook G3 Series computers are IrDA compliant. This is the first PowerBook model which does not support IrTalk. Any older PowerBook model, which can only communicate with IrTalk, will not be able to connect to the PowerBook G3 Series (Bronze Keyboard) models.

Note: See PowerBook 3400, PB 2400, and PowerBook G3 and G3 Series information listed above.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read Tech Info Library article 24604: "[PowerBook G3, G3 Series: Identifying Different Versions](#)"

PowerBook Infrared: Is It IrDA Compatible? (5/97)

Revised: 5/2/97
Security: Everyone

PowerBook Infrared: Is It IrDA Compatible? (5/97)

Article Created: 6 February 1997
Article Reviewed/Updated: 2 May 1997

TOPIC -----

Does the built-in infrared technology used in the PowerBook 190, 5300, 1400, and 3400 series computers support the IrDA (Infrared Data Association) standard?

Can I use the infrared port on my PowerBook 190, 5300, 1400, or 3400 series computer to communicate with my Hewlett Packard IrDA Printer, or to a Newton MessagePad with an infrared port?

DISCUSSION -----

PowerBook 190, 5300, and 1400

PowerBook 190, 5300, and 1400 series computers are not IrDA-compliant. Hence, these computers do not work with third-party devices which are IrDA compliant.

The infrared implementation used in these PowerBook computers is designed to share information with other infrared-equipped PowerBook computers and the Farallon Air Dock (a wireless LocalTalk filesharing solution). The Apple IR File Exchange transfer rate is 230.4kbs, the same as LocalTalk.

The PowerBook 190, 5300, and 1400 series computers do not use the same infrared technology as some of Apple's MessagePad devices and some Hewlett Packard printers, which need IrDA support to communicate. Instead, these PowerBooks use a protocol named IRTalk.

PowerBook 3400 Series

The PowerBook 3400 series computers are IrDA compliant. Additionally, they have the option to switch to the IRTalk protocol by using the Infrared Control Panel.

PowerBook 3400 computers can therefore communicate with other IRTalk-capable devices (such as other PowerBooks) using the IRTalk protocol.

PowerBook 3400 computers have the hardware necessary to communicate with other IrDA compliant devices such as the Apple eMate 300 or the Newton MessagePad 2000. At this time Apple does not have a software solution to communicate with the Newton 2000 and eMate 300 through IrDA.

For information about whether or not a PowerBook 3400 can communicate with HP printers, contact Hewlett Packard. For information about whether PowerBook 3400 computers can communicate with other IrDA compliant devices, contact the manufacturer of the device.

MAE 3.0: Obtaining Volume or Multiple License Keys (1/97)

Revised: 2/6/97
Security: Everyone

MAE 3.0: Obtaining Volume or Multiple License Keys (1/97)

Article Created: 6 February 1997

TOPIC -----

This article describes the procedure for obtaining a volume (multiple) license keys for Macintosh Application Environment (MAE) 3.0. The process differs from previous versions of MAE.

DISCUSSION -----

Users who order a volume license for the MAE 3.0 from Claris will receive these two important items:

- The "Volume License Agreement" from Claris. This document is NOT inside the product package, and has code number which is needed for a volume license.
- The MAE product package which contains the MAE 3.0 software and documentation on a CD-ROM disc, plus two important paper documents. There is only one distributed software product which is identical for single user and volume user licenses. Below is a description of the two paper documents inside the package:
 - "About MAE 3.0 License Keys" which broadly describes how an administrator should decide to install the license keys, and how the keys are obtained from the license vendor, Globetrotter. The reverse side of this document contains contact information for product support.
 - "MAE 3.0 License Registration" which is filled out and Faxed to the license registration Fax system. This document has a sticker with a unique single-user authorization code that is the only code necessary to obtain a single-user license key.

Both single-license users and volume administrators must submit the "MAE 3.0 License Registration" form to the license vendor, Globetrotter, to obtain a

valid and permanent single-user MAE 3.0 license key file.

In addition to the unique single-user authorization code attached to the "MAE 3.0 License Registration" form, volume users must also supply the Claris' "Volume License Agreement" code number to the "MAE 3.0 License Registration".

While a soft copy of the Registration form is provided in Adobe Acrobat format on the compact disc, neither license, nor volume agreement code number is entered. Both must be entered in by the applicant along with other requested information.

Licensing is controlled by flex-lm software from Globetrotter. All license keys are issued by Globetrotter only in response to a Fax or e-mail (preferred) submission. Turn around time for license key files may be one business day when e-mail is used.

IMPORTANT: The volume license applicant must supply the Claris Volume License Agreement code number. If this is not done, Globetrotter will correctly issue only a single-user license, regardless of the quantity entered in the number of licenses requested field.

NOTE: If an applicant desires to implement more than a single license key file for his licensees, then the applicant must supply information about the distribution desired. For example, a fifty user license might be broken down as a group of twenty and thirty individual licenses. This would let thirty users have exclusive access, and an additional twenty 'floating' licenses.

NOTE: If individual licenses are to be run locally on the user's workstation, then the individual host ids of these machines must also be provided for correct key generation.

LW 12/640 PS: Can't Get Legal-Sized Pages Printed Face-Up (2/97)

Revised: 2/7/97
Security: Everyone

LW 12/640 PS: Can't Get Legal-Sized Pages Printed Face-Up (2/97)

=====

Article Created: 7 February 1997

TOPIC -----

We have a LaserWriter 12/640 PS and are unable to select the face-up output tray when we print Legal-sized pages. When I attempt to select the Face-Up tray in the Print dialog, it is dimmed. We have tried various versions of LaserWriter 8 printer driver including the latest v8.4.2, and have also tried this with and without a duplexer. Is this a supported feature with Legal-sized pages?

DISCUSSION -----

The LaserWriter 12/640 PS User's Guide on page 184 "Selecting the output tray" states:

Note: You cannot direct the output to face-up when duplex printing. You cannot direct U.S. legal-size paper to the face-up output."

The face-up tray cannot accommodate a legal-sized page. Because of this, it was decided that limiting the face-up tray for use with legal-sized pages would be a more elegant solution than having the paper fall off the tray.

Pwr Macintosh 7300, 8600,9600: Support EDO Memory? (2/97)

Revised: 2/24/97
Security: Everyone

Pwr Macintosh 7300, 8600,9600: Support EDO Memory? (2/97)

Article Created: 7 February 1997
Article Reviewed/Updated: 24 February 1997

TOPIC -----

I heard that the Power Macintosh 7300, 8600, and 9600 series computers ship with EDO memory installed. Does this mean these computers support EDO memory?

DISCUSSION -----

Although the Power Macintosh 7300, 8600, and 9600 series computers do ship with EDO (Extended Data Out) memory installed, these computers are not EDO compatible.

The memory controller of these computers does not support EDO memory. Instead, the EDO memory in these computers functions as FPM (Fast Paged Mode) memory.

The Hindi Learning Stack: Read Me (2/97)

Revised: 2/13/97
Security: Everyone

The Hindi Learning Stack: Read Me (2/97)

Article Created: 7 February 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains the ReadMe file for the Hindi Learning Stack v1.0, which is included with the Indian Language Kit.

DISCUSSION -----

This document provides information for installing and using the Hindi Learning Stack. In particular, it explains the following

- What is the Hindi Learning Stack?
- Hindi Learning Stack 1.0 Contents
- System Requirements
- Installing the Hindi Learning Stack
- Running the Hindi Learning Stack
- Using the Hindi Learning Stack
- Hindi Learning Stack Games

What is the Hindi Learning Stack?

=====

The Hindi Learning Stack 1.0 is a Hypercard application. It helps to teach the Hindi alphabet, especially to children. It also contains three games aimed at testing alphabet recognition skills.

the Hindi Learning Stack 1.0 contents

=====

the Hindi Learning Stack 1.0 consists of the following files:

- Hindi Learning Stack 1.0
- Hindi Learning Stack
- Gaayab!!
- Hindi Learning Stack 1.0 Read Me

System Requirements

=====

The Hindi Learning Stack 1.0 requires

- Macintosh Computer (Power Macintosh or 68K system)
- System 7.5 or better
- Color or gray scale monitor capable of atleast 256 colors / grays
- Display resolution of 640 by 480 pixels or better
- At least 6.5 MB of available RAM

Installing the Hindi Learning Stack

=====

To install the Hindi Learning Stack, drag the the Hindi Learning Stack 1.0 folder from Indian Language Kit CD on to your hard disk.

Running the Hindi Learning Stack

=====

Open the Hindi Learning Stack 1.0 folder and double-click on the Hindi Learning Stack 1.0 icon. A poem and background music will play while a welcome screen is being displayed. Click on the Hindi Learning Stack screen to continue. You will see the parrot (Sonu) and the girl (Monu) flying across the screen. Sonu and Monu will lead you to the first alphabet card.

Using the Hindi Learning Stack

=====

The Hindi Learning Stack has two sections - Alphabet Teacher and the Games.

Alphabet Teacher

Alphabet teacher takes you through a series of alphabetical cards and teaches you the Hindi alphabets.

Each alphabet card has the following buttons at the bottom:

1. Left button - Goes to the previous alphabet card.
2. Music button - Toggles the background music on or off.
3. Help button - Gives a brief description of all buttons.
4. Games button - Plays Hindi Learning Stack games.
5. Main menu - Shows the main menu of all letters in the alphabet. Click on any letter to go directly to that particular alphabet card.
6. Right button - Goes to the next alphabet card.

Each alphabet card teaches two or three related alphabets. It includes the letter itself, simple words beginning with the alphabet and pictures of familiar objects. When you come into any alphabet card, Sonu will pronounce the letters of that card for you. Repeat the pronunciation by clicking on the letter or the word again. Try clicking on the picture objects or on Monu.

Hindi Learning Stack Games

The Hindi Learning Stack includes the following three games

1. Talking Tree Game (Batooni Paed)
2. Card game (Bataon to Jaane)
3. Find the missing alphabet game (Gaayab))

- Talking Tree game: You can play this game at three levels. The first level is

simple. It displays a tree with 5 letters. You will be asked to click on a particular letter. Click on the letter that Sonu asks you to select. You receive 2 points for every correct answer, reflected in your final score. Levels 2 and 3 will display a tree with 10 letters. Be careful in level 3! You will lose 2 points for every wrong guess. Sonu will repeat the letter to be selected when you click on the repeat button. If you find it difficult to pick the right letter, click on the clue button and the Hindi Learning Stack will flash the alphabet card with the correct letter.

- Flashcards game: The Hindi Learning Stack will display 3 pictures for you. You will be asked to identify the picture for the letter or word displayed. You get 2 points for every correct guess.

- Find The Missing Letter game: The Hindi Learning Stack will display a sequence of letters, with one letter missing. Sonu will also give you five likely answers. You are expected to identify the missing letter.

After completing one round, the Hindi Learning Stack will start a new round for you. You may also click on the right arrow at any time to discard the current round and start a new round.

To finish using the Hindi Learning Stack application, click on the door icon in main menu or press <Command> + Q keys.

Devanagari Typing Shikshak: Read Me (2/97)

Revised: 2/14/97
Security: Everyone

Devanagari Typing Shikshak: Read Me (2/97)

=====

Article Created: 7 February 1997
Article Reviewed/Updated: 14 February 1997

TOPIC -----

This article contains the Readme file for the Devanagari Typing Tutor, which is included with the Indian Language Kit.

DISCUSSION -----

Installation

=====

To install, drag the file Devanagari Typing Shikshak on to your hard disk. Make sure that the Indian Language Kit is installed prior to launching the tutor.

Minimal System Requirements

=====

- * Macintosh Computer (PowerPC or 68K)
- * Indian Language Kit 1.0
- * Monitor capable of 640 x 480 pixels or better

Features

=====

The Shikshak teaches you to type using the Inscript keyboard (default keyboard layout for Indian languages).

The Shikshak organizes lessons in "practice sessions" and "drills." Before you begin a lesson, read the introduction which describes the keys, their location and the fingers you need to use to type them. The Shikshak shows a preview of the key to be typed. The key is shown highlighted. If the key to be typed is a shifted one, shift is also highlighted.

Once you have completed practicing keystrokes, you will be shown words to type, formed with the keys you have learned. The Shikshak beeps when an incorrect key is entered.

Once the drill is complete, a dialog box showing the accuracy and speed during the lesson is displayed.

Use the "View" menu option to navigate between the lessons. The "Next" and "Prev" menu items take you to the next or previous lesson from the current one. The "Go To..." menu item allows you direct access to any lesson of Shikshak.

Use the navigation buttons, "Next Lesson" and "Prev Lesson" (same as Next and Prev menu option), to go to the next or previous lesson from the current one. The "Start Drill" button ends the practice and starts the drill. Choose "Restart Drill" to start the drill again.

The keyboard shown in the Shikshak depicts the Apple Extended keyboard. Some keys are positioned differently on various Apple keyboards. One such key is the backslash (\) key, positioned above the return key in the Extended keyboard. It is situated to the right of the space bar on Apple standard keyboards.

The Inscript keyboard provides various conjuncts on the shifted number row of the keyboard. The conjuncts are covered in the lessons which teach the required keys. These conjuncts can be typed using the individual letters which make them or using the shifted number key directly.

Extensions Compatibility

=====

The Typing Shikshak has known incompatibilities with the Aaron extension. The most prominent is the disappearing of text in the drills. This incompatibility is not consistent.

Keys not covered by the Shikshak

=====

Some keys of the Inscript keyboard have not been covered in this Shikshak. These keys are used in southern scripts or are not used very often in Devanagari. These letters, as per their ISCII reference are:

Vowel Sign O (southern scripts)
Vowel Sign AWE (Devanagari script)
Vowel Sign E (southern scripts)
Vowel O (southern scripts)
Vowel AYE (Devanagari script)
Vowel Sign AYE (Devanagari script)
Vowel RI
Consonant NGA
Vowel AWE (Devanagari script)
Consonant Hard Ra (southern script)
Vowel E (southern script)
Consonant NA (Tamil)
Consonant ZHA (Tamil & Malayalam)
Consonant Hard LA
Consonant JYA (Bengali, Assamese & Oriya)

System 7.5.x Troubleshooting (2/97)

Revised: 2/7/97
Security: Everyone

System 7.5.x Troubleshooting (2/97)

Article Created: 7 February 1997

TOPIC -----

This article provides troubleshooting tips to help solve problems with System 7.5 Update 2.0 and a Mac OS-based computer.

DISCUSSION -----

Print this document This document contains troubleshooting information that you may need when the computer is not turned on. For reference, keep a printed copy of this document near your computer. To print this document, open the File menu and choose Print.

Contents

This document provides information about what to do if your computer freezes:

- when the "happy Macintosh" icon appears during startup
- while system software extensions are being loaded during startup
- after startup as the Finder is being started
- while the computer is turned on but not being used (idle)
- when starting, using, or quitting an application program
- when printing from an application program

Before You Read This Document

It is a good idea to try to pinpoint when the freezes or hangs you experience with your computer first began to occur. For instance, if you installed additional memory in your computer and the freezes or hangs began to occur after that, the problems are likely to have something to do with the memory or the way it was installed. Two other actions that sometimes cause problems are connecting a new SCSI device to your computer (the device, its cable, or its SCSI ID number may cause problems), or installing new software (the software may contain

incompatibilities or need more memory than is actually available).

Other Sources Of Troubleshooting Information

Besides this document and online services, there are several other good sources of troubleshooting information:

- User's manual. See the troubleshooting section of the user's manual that came with your computer for detailed troubleshooting instructions.
- Macintosh Guide. Open the Guide menu and choose Macintosh Guide. (The Guide menu is under the question mark near the upper right corner of your screen). Click the Index button in Macintosh Guide, and choose a topic from the index.
- Apple Technical Information Library (TIL). The TIL can be found on several online services including America Online and Compuserve, and Apple Computer's Internet web site @ <http://www.info.apple.com/>.

The Computer Freezes When The Happy Macintosh Icon Appears During Startup

When the computer first starts up you see a smiling "happy Macintosh" icon. (If you see a "sad" icon or one with a question mark, refer to the user's manual that came with your computer.) If the computer freezes while the happy Macintosh icon is on the screen, follow the steps below.

- 1) Remove any SCSI or serial devices attached to your computer:
 - Turn the computer off by pressing the power switch on the back of the computer.
 - Disconnect any devices attached to the computer's external SCSI and serial (printer and modem) ports.
 - Wait 7-10 seconds. This allows time for the hard disk drive to stop spinning.
 - Turn the computer on by pressing the power switch on the back of the computer.
- 2) If the computer starts up successfully, try the following:
 - Shut down the computer and plug the devices back in one at a time. The problem may be with one of the devices. Restart after each device to identify which one is causing the problem.
 - Refer to the user's manual that came with the computer for more information about SCSI devices, and refer to the devices' manuals and manufacturers.
- 3) If after unplugging all SCSI and serial devices the computer continues to freeze at the "happy Macintosh" icon, try the following:
 - Start up from a CD-ROM disc that contains system software for your computer, or a Disk Tools floppy disk. Then run Disk First Aid to make sure that the hard disk is OK.
 - Test the hard disk using Apple HD SC Setup or Drive Setup (whichever came with your computer).

Refer to the user's manual that came with your computer for instructions on starting from a CD-ROM disc or Disk Tools disk and using Disk First Aid, Apple HD SC Setup, or Drive Setup.

If the computer does not start up successfully after you test the hard disk, perform a clean installation of system software. Follow the instructions for doing a clean installation in the Troubleshooting section of the user's manual that came with your computer (for Power Macintosh 5200/5300 LC computers), or in the Macintosh Performa CD booklet (Performa computers).

If the computer still freezes during startup after a clean installation of system software, or if it freezes at the "happy Macintosh" icon while starting up from the compact disc or Disk Tools floppy disk, take the computer to an Apple-authorized service provider.

Computer Freezes While System Software Extensions Are Loading

During startup a line of icons "march" across the bottom of your screen. These icons represent the system software extensions being loaded (started) on your computer. If the computer freezes at this point in the startup, follow the steps below.

- 1) Remove any SCSI or serial devices attached to your computer:
 - Turn the computer off by pressing the power switch on the back of the computer.
 - Disconnect any devices attached to the computer's external SCSI and serial (printer and modem) ports.
 - Wait 7-10 seconds. This allows time for the hard disk drive to stop spinning.
- 2) Turn off all unnecessary system software extensions:
 - Open the Special menu and choose Restart while holding down the space bar. The Extensions Manager control panel opens.
(If you can't open the Special menu, press the Command, Control, and Power keys simultaneously while holding down the space bar. The Command key is marked with a "curly" icon, and the Power key is marked with a triangle.)
 - Open the "Sets" pop-up menu and choose "System 7.5.3" or "System 7.5" (whichever is available).
 - Open the Special menu and choose Restart.
- 3) If the computer starts up successfully, try the following:
 - Open the Apple menu and choose Control Panels.
 - Double-click the Extensions Manager to open it. In the list of extensions only the ones required for system software version 7.5.3 are turned on (marked with a check mark); the rest are turned off (disabled).
 - The problem may be with an extension or control panel that is not compatible with your computer. Try turning on each of the disabled extensions, restarting after each extension, to identify which one is causing the problem. (To turn on an extension, click to put a check mark next to it.)

For more information about incompatible extensions and other software, refer to the user's manual that came with your computer or contact the company that supplies the software.

If the computer does not start up successfully after you follow steps 1-3 above, perform a clean installation of system software. Follow the instructions for doing a clean installation in the Troubleshooting section of the user's manual that came with your computer (for Power Macintosh 5200/5300 LC computers), or in the Macintosh Performa CD booklet (Performa computers).

If the computer still freezes during startup after a clean installation of system software, take the computer to an Apple-authorized service provider.

IMPORTANT: Before you plug your SCSI or serial devices back into the computer, be sure the computer is shut down and turned off.

The Computer Freezes As The Finder Is Being Loaded

During startup the Finder (the program that runs your computer and keeps its activities organized) is loaded after the line of icons representing your computer's system software extensions have finished "marching" across the screen. If the computer freezes at this point in the startup, follow these steps:

- 1) Turn off all unnecessary system software extensions:
 - Open the Special menu and choose Restart while holding down the space bar. The Extensions Manager control panel opens.
(If you can't open the Special menu, press the Command, Control, and Power keys simultaneously while holding down the space bar. The Command key is marked with a "curly" icon, and the Power key is marked with a triangle.)
 - Open the "Sets" pop-up menu and choose "System 7.5.3" or "System 7.5" (whichever is available).
 - Open the Special menu and choose Restart.
- 2) If the computer starts up successfully, try the following:
 - Open the Apple menu and choose Control Panels.
 - Double-click the Extensions Manager to open it. In the list of extensions only the ones required for system software version 7.5.3 are turned on (marked with a check mark); the rest are turned off (disabled).
 - The problem may be with an extension or control panel that is not compatible with your computer. Try turning on each of the disabled extensions, restarting after each extension, to identify which one is causing the problem. (To turn on an extension, click to put a check mark next to it.)

For more information about incompatible extensions and other software, refer to the Troubleshooting section of the user's manual that came with your computer or contact the company that supplies the software.

3) If the computer still freezes as the Finder is being loaded, try the following:

- Open the Special menu and choose Restart while holding down the Option key. The Extensions Manager control panel opens.
(If you can't open the Special menu, press the Command, Control, and Power keys simultaneously while holding down the Option key. The Command key is marked with a "curly" icon, and the Power key is marked with a triangle.)

If the computer still does not start up successfully, perform a clean installation of system software. Follow the instructions for doing a clean installation in the Troubleshooting section of the user's manual that came with your computer (for Power Macintosh 5200/5300 LC computers), or in the Macintosh Performa CD booklet (Performa computers).

If the computer still freezes during startup after a clean installation of system software, take the computer to an Apple-authorized service provider.

The Computer Freezes While It Is Turned On But Not Being Used

1) Turn off all unnecessary system software extensions:

- Open the Special menu and choose Restart while holding down the space bar. The Extensions Manager control panel opens.
(If you can't open the Special menu, press the Command, Control, and Power keys simultaneously while holding down the space bar. The Command key is marked with a "curly" icon, and the Power key is marked with a triangle.)
- Open the "Sets" pop-up menu and choose "System 7.5.3" or "System 7.5" (whichever is available).

2) Remove any screen saver programs:

- Double-click the System Folder (on the hard disk) to open it.
- Check to see if any screen savers are in the System Folder. The screen saver programs may be inside the Control Panels folder or the Extensions folder.
- Temporarily disable or remove any screen saver programs. Some incompatible screen savers can cause freezes. For more information about incompatible software, refer to the user's manual that came with your computer and contact the company that supplies the screen saver.
- Open the Special menu and choose Restart.

If the computer still freezes when it is not in use perform a clean installation of system software. Follow the instructions for doing a clean installation in the Troubleshooting section of the user's manual that came with your computer (for Power Macintosh 5200/5300 LC computers), or in the Macintosh Performa CD booklet (Performa computers).

If the computer still freezes during startup after a clean installation of system software, take the computer to an Apple-authorized service provider.

Computer Freezes When An Application Is Being Started, Used, Or Quit

This problem can occur when an application program needs more memory than its actually available, or when a program is incompatible with the computer's system software.

- 1) Check to see how much available memory your computer has:
 - Open the Special menu and choose Restart.
(If you can't open the Special menu, press the Command, Control, and Power keys simultaneously. The Command key is marked with a "curly" icon, and the Power key is marked with a triangle.)
 - After the computer starts up, open the Apple menu and choose About This Macintosh.
 - Make a note of the number next to "Largest Unused Block." This is the amount of available memory on the computer.
- 2) Check to see how much memory the application program requires:
 - Click the icon for the application program you are trying to open or use.
 - Open the File menu and choose Get Info.
 - Check the Memory Requirements box. In order to open and run properly, the computer's available memory must be greater than the number next to "Minimum size" in the Memory Requirements box.
- 3) If necessary, make more memory available for the program:
 - To learn how to make more memory available for a program, look for help in Macintosh Guide. Open the Guide menu and choose Macintosh Guide. (The Guide menu is under the question mark near the upper right corner of your screen).
 - Click the Index button in Macintosh Guide, and choose "memory" in from the index. The help topics appear on the right. The "How do I" help topics contain the information you need, particularly the topics regarding making more memory available, changing the memory a program uses, and using hard disk space as memory.
- 4) If the computer still freezes when you use the program, turn off all unnecessary system software extensions:
 - Open the Special menu and choose Restart while holding down the space bar. The Extensions Manager control panel opens.
(If you can't open the Special menu, press the Command, Control, and Power keys simultaneously while holding down the space bar. The Command key is marked with a "curly" icon, and the Power key is marked with a triangle.)
 - Open the "Sets" pop-up menu and choose "System 7.5.3" or "System 7.5" (whichever is available).
 - Open the Special menu and choose Restart.
- 5) If the computer still freezes when you use the program, turn off the Modern Memory Manager or 32-bit addressing:
 - Open the Apple menu and choose Control Panels.
 - Double-click the Memory control panel to open it.
 - Turn off the Modern Memory Manager (for Power Macintosh computers) or 32-bit addressing (for earlier Macintosh computers).

Some older programs may not be compatible with these options. If the program works with these options turned off, contact the company that supplies the program for a more recent version.

If the computer still freezes when you open or use the program, the program may not be compatible with your computer. Check the manuals that came with the program or contact the company that supplies the program to determine if the program is compatible with your computer.

The Computer Freezes When Printing From An Application

First, follow all the instructions under "The computer freezes when an application program is being started, used, or quit," above.

If the computer still freezes when printing, follow the additional steps below.

- 1) If the problem only occurs during Background Printing, increase the Memory Requirements for the PrintMonitor program:
 - Double-click the System Folder (on the hard disk) to open it.
 - Double-click the Extensions folder (inside the System Folder) to open it.
 - Click the PrintMonitor program to highlight it.
 - Open the File menu and choose Get Info.
 - In the Memory Requirements box, increase the number next to "Minimum size" to at least 160.

Note: You can also try turning on virtual memory. See the instructions earlier in this document for opening Macintosh Guide and learning about virtual memory.

- 2) If the computer still freezes when printing, turn off Background Printing:
 - Open the Apple menu and choose the Chooser.
 - In the upper left box in the Chooser, click the software for your printer (for example, "LaserWriter 8") to highlight it.
 - Under Background Printing on the right side of the Chooser, click the Off button.

If the computer still freezes when printing, the print driver may not be compatible with the application or system software. Check the manuals that came with the printer documentation or contact the manufacturer of the printer to determine if the print driver is compatible with your computer.

LaserWriter Pro 810: Set, Define, Change Usage (2/97)

Revised: 2/7/97
Security: Everyone

LaserWriter Pro 810: Set, Define, Change Usage (2/97)

=====

Article Created: 7 February 1997

TOPIC -----

I am using the maintenance port on the LaserWriter Pro 810 to change some of the settings. However, when I issue the SET commands, power off the printer, then power it back on, the commands are not retained. Why?

DISCUSSION -----

When using the Remote Console Facility (RCF), there are three different commands you need to use; SET, DEFINE, and CHANGE.

SET

Temporary change. Commands entered using the SET command are lost when the printer reinitialized.

DEFINE

Permanent change, effective when the printer is reinitialized.

CHANGE

Permanent change, effective immediately.

In your example, the DEFINE or CHANGE command may be more appropriate if the change needs to be permanent.

Mac OS 7.6 CD and Computers With 8 MB RAM (2/97)

Revised: 2/7/97
Security: Everyone

Mac OS 7.6 CD and Computers With 8 MB RAM (2/97)

=====

Article Created: 7 February 1997

TOPIC -----

Mac OS 7.6 CD's packaging and manual list the memory requirements as, "8 MB installed RAM, with an additional 8 MB through installed RAM or Virtual Memory."

DISCUSSION -----

The memory requirements as listed on the packaging and manual are correct. However, an optional installation of QuickDraw 3D requires at least 16 MB of installed memory. The Apple Internet Connection Kit 1.2, included with the Mac OS 7.6 CD, requires at least 12 MB of installed memory. Therefore, if you install some of the software included on the Mac OS 7.6 CD, you will need more than 8 MB installed RAM.

Mac OS 7.6: Wacom Tablet (2/97)

=====

Article Created: 7 February 1997

TOPIC -----

This article describes running Mac OS 7.6 with a Wacom Tablet.

DISCUSSION -----

If you install Mac OS 7.6 on your computer with a Wacom tablet, make sure you have the latest Wacom driver version 2.5.1 and remove the OpenTpt Serial Arbitrator from your system. Wacom has an extension called SerialDMA which replaces the OpenTpt Serial Arbitrator.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Indian Language Kit: Troubleshooting (2/97)

Revised: 2/13/97
Security: Everyone

Indian Language Kit: Troubleshooting (2/97)

Article Created: 7 February 1997
Article Reviewed/Updated: 13 February 1997

TOPIC -----

This article contains troubleshooting suggestions for the Indian Language Kit. These tips were taken from the Indian Language Kit User's Manual.

DISCUSSION -----

1) I can't work in the Indian language of my choice with my usual application program.

Your application program may not be compatible with WorldScript I or QuickDraw GX. If it is not, it won't automatically switch to an Indian language font when you select an Indian language keyboard, or it may not let you see the fonts in the font menu.

To make sure your application program is compatible with WorldScript I and QuickDraw GX, consult the program's manufacturer or the dealer from whom you purchased the program.

2) I see odd characters that I can't read in some of my file and folder names.

The font your system uses for file and folder names does not contain any Indian language characters. Open the Views control panel and choose an Indian language from the "Font for views" pop-up menu.

3) I changed my Views control panel to an Indian language font, but I still see odd characters in my Application menu.

The Application menu is unaffected by the changes you make in the Views control panel. However, the icons that appear in the Application menu next to each program's name will help you identify your Indian Language programs.

4) I can't edit an Indian language file or folder name.

You may have the wrong keyboard selected in the Keyboards menu. Open the Keyboards menu and select the right keyboard for your language.

5) Ever since I installed the Indian Language Kit, I haven't been able to work with some of my other application programs, even in Roman.

This problem may be caused by insufficient memory. However, if you are sure your computer has enough memory, the program may be due to incompatibility between non-Roman scripts and a particular application program. Try registering that application as an English language application. To do this, use the Language Register program in the Extras folder on the disk where you installed the Indian Language Kit. If you still have problems working with the application, you may have to deactivate the Indian Language Kit to use with the application. You can do so by disabling the WorldScript I extension in the Extensions Manager control panel.

6) After I installed the Indian Language Kit, unwanted keyboard layouts appeared in my Keyboards menu. How do I remove them?

Open the System file in the System Folder, select the unnecessary keyboard layouts, and drag them to the Trash or to a temporary folder.

7) When I open the Keyboards menu, my Indian language keyboards are not highlighted, so I cannot choose them.

You don't have a text field currently open that supports these keyboard layouts. Open SimpleText or any text field you would use for your Indian languages, and the Indian language options will be highlighted along with the other keyboard options in your Keyboards menu.

8) When I open the Font menu, I see several different fonts listed for each Indian language. Which font should I use?

After you install the Indian Language Kit, your Font menus contain at least two fonts for each Indian Language. These fonts have different suffix--for example, Devanagari MTS and Devanagari MT. You should use the MT version of each Indian language font. (Do not use the MTS version; MTS fonts use Chicago as their associated Roman font and have no bold style).

Furthermore, if you have QuickDraw GX installed, you will see some additional fonts at the top of the Font menu that begin with a period (.)--for example: .Devanagari Mt. Do NOT use these fonts.

The following list shows the fonts that you should NOT use. (You cannot remove these fonts from your Font menu.)

.Devanagari MT X
.Devanagari MT X (Bold)
.Gujarati MT X
.Gujarati MT X (Bold)
.Gurmukhi MTX
.Gurmukhi MTX (Bold)
Devangari MTS
Gujarati MTS
Gurmukhi MTS

AIX: White Screen After Typing xinit Command (2/97)

Revised: 2/10/97
Security: Everyone

AIX: White Screen After Typing xinit Command (2/97)

=====

Article Created: 10 February 1997

TOPIC -----

When trying to start CDE, I typed the command below, from the user manual, and got a white screen:

```
xinit /usr/dt/bin/dtlogin
```

What happened, and how do I exit?

DISCUSSION -----

You are in X-windows. You can exit X-windows by pressing the key sequence control-alt-delete. (The delete key is the one above the return key.) This will kill the X-server and the prompt should appear.

If you are defaulting to a command line login, the "xinit /usr/dt/bin/dtlogin" command will take you to CDE. However, if you enter the login from CDE and pick the command line login option, you must type exit at the command line to return to CDE.

PowerBook 3400 Series: Description (2/97)

Article Created: 10 February 1997
Article Reviewed/Updated: 14 February 1997

TOPIC -----

This article contains a description of the Macintosh PowerBook 3400 series computers which includes the PowerBook 3400/180, 3400/200, and 3400/240 models.

DISCUSSION -----

Overview
=====

The Apple Macintosh PowerBook 3400 series takes Apple's most acclaimed feature -- ease of use -- and combines it with desktop-level performance, state-of-the-art multimedia, and quick and easy communications capabilities. These systems are the optimal choice for mobile professionals who want access to top-of-the-line notebook computer technology.

Macintosh PowerBook 3400 systems sport the fastest processors ever offered in a PowerBook computer. With their 180-, 200-, or 240-megahertz PowerPC 603e processor with 256K level 2 cache, they rival desktop computer performance. In fact, they rival desktop capabilities in a number of other areas as well.

For example, these systems' multi-media capabilities allow mobile professionals not only to give presentations on the road or in the office, but also to create media-rich presentations whenever and wherever they want. The Macintosh PowerBook 3400 series features a 12.1-inch active-matrix display, 6x- or 12x-speed CD-ROM drive (most configurations), 16-bit video-out capability, video-in with zoomed video, and unique four-speaker sound system.

Communications is the other key concern of mobile professionals, and the PowerBook 3400 series is equally strong in this area. Featuring built-in Ethernet and high-speed, 33.6-kilobit-per-second modem capabilities (most configurations), this series offers the communications efficiency that makes staying in touch quick and easy. In fact, these advanced portables provide the

flexibility to use the appropriate communications technology at any given site and in any given situation'whether that involves connecting to an organizational intranet, logging onto the Internet, or downloading information from a remote server.

In short, with its unparalleled combination of performance, multimedia capabilities, and built-in communications technology, the Macintosh PowerBook 3400 series gives you the power to do virtually anything you want to do with a computer -- anywhere.

Features

=====

High performance

- * Brings the fastest processor technology ever to a PowerBook system, with a 180-, 200-, or 240-MHz PowerPC 603e processor and 256K level 2 cache
- * Features industry-standard PCI architecture
- * Uses lithium-ion battery technology for light weight and long battery life

State-of-the-art multimedia

- * Features a large, 12.1-inch (diagonal) active-matrix SVGA display that supports thousands of colors
- * Offers outstanding video capabilities, including graphics acceleration through its PCI-based video controller
- * Provides an ideal environment for creating and presenting complex multimedia content
- * 180- and 200-MHz systems Include a removable, internal CD-ROM drive (most configurations); 240-MHz systems include a 12x-speed CD-ROM drive
- * Comes with four built-in speakers with active crossover for rich sound quality
- * Features 16-bit stereo sound input/output ports and integrated microphone

Advanced communications capabilities

- * Provides built-in Ethernet and modem (most configurations) for fast, versatile networking and communications capabilities
- * Comes with built-in 1-megabit IrDA infrared technology for easy, wireless LAN access and file sharing with similarly equipped systems

Flexible expansion options

- * Offers one RAM expansion slot for memory enhancement up to 144 MB
- * Accommodates two Type II PC Cards or one Type III PC Card for additional networking, storage, and modem options
- * Features an expansion bay for the floppy disk drive, CD-ROM drive, or third-party solutions such as a second hard disk drive, magneto-optical drive, or Zip drive

Bundled productivity software

- * Includes Claris Organizer and WebWhacker (an "offline browsing tool"), as well

as demo and game programs

- * Comes with Apple Internet Connection Kit
- * Provides software for remote access and cross-platform compatibility
- * Features Apple Location Manager software, which allows you to easily switch system settings that vary by location (printer, networking, and so on)

PowerBook 3400 Series: Technical Specifications (2/97)

=====

Article Created: 10 February 1997
Article Reviewed/Updated: 14 February 1997

TOPIC -----

This article contains the technical specifications for the Macintosh PowerBook 3400 series computers which includes the PowerBook 3400/180, 3400/200, and 3400/240 models.

DISCUSSION -----

Technical Specifications
=====

Microprocessor

- * 180-, 200-, or 240-MHz PowerPC 603e; 256K level 2 cache

Memory

- * 16 MB of RAM, expandable to 144 MB

Storage

- * Apple SuperDrive 1.4 MB floppy disk drive
- * Internal 1.3 GB, 2 GB, or 3 GB hard disk drive
- * 6x-speed CD-ROM drive module (most configurations);
12x-speed CD-ROM (3400c/240 system)

Display

- * 12.1-in. (diagonal) active-matrix color SVGA display
- * Resolution: 800 by 600 pixels
- * 1 MB of VRAM supports 8-bit color video output to 21-inch monitor; supports thousands of colors on smaller monitors in SVGA mode
- * Includes hardware-based graphics acceleration

Expansion capabilities

- * One memory expansion (RAM) slot
- * Slots for two Type II PC Cards or one Type III PC Card
- * Expansion bay for floppy disk drive, 6x-speed or 12x-speed CD-ROM drive, or third-party storage or back-up solutions; also supports all of the Macintosh PowerBook 190 and 5300 series expansion bay modules

Battery

- * Lithium ion (LiIon: 32-watt hour)
- * Average life: 2 to 4 hours, depending on environment
- * Also supports nickel-metal-hydride (NiMH) battery technology

Ports

- * Apple Desktop Bus (ADB) port
- * Serial (RS-422) port
- * VGA video-out port
- * SCSI port can accommodate six external devices
- * Infrared technology port (IrDA compliant)
- * Power adapter port
- * Stereo sound input/output ports
(16-bit, CD-quality stereo input/output)

Networking and communications

- * Built-in 10BASE-T Ethernet (most configurations)
- * Built-in 33.6-Kbps modem (most configurations)
- * Built-in infrared technology supports AppleTalk protocols and 1 Mb IrDA standard

Security

- * Security slot for locking to stationary object
(requires third-party security cable)
- * Password security software

Sound

- * Four built-in speakers with active crossover
- * 16-bit, CD-quality stereo input/output
- * Integrated microphone

Keyboard

- * Built-in full-size keyboard with 76 (U.S.) or 77 (ISO) keys, including 12 function keys

Apple trackpad

- * Solid-state Apple trackpad provides precise cursor control; sensing of

movement and acceleration can be easily adjusted through a control panel;
supports tap, double-tap, and drag capabilities

Electrical requirements

- * Line voltage: 100 to 220 volts AC
- * Frequency: 50 to 60 Hz

Environmental requirements

- * Operating temperature: 50 degrees to 104 degrees F
(10 degrees to 40 degrees C)
- * Storage temperature: -13 degrees to 140 degrees F
(-25 degrees to 60 degrees C)
- * Relative humidity: 20 percent to 90 percent noncondensing
- * Operating altitude: 0 to 10,000 feet (0 to 3,048 meters)
- * Maximum storage altitude: 20,000 feet (6,300 meters)

Size and weight

- * Height: 2.4 inches (6.1 cm)
- * Width: 11.5 inches (29.2 cm)
- * Depth: 9.5 inches (24.1 cm)
- * Weight: 7.2 pounds (3.2 kg) with floppy disk drive installed;
7.4 pounds (3.3 kg) with CD-ROM module;
6.9 pounds (3.1 kg) with PC Card carrying case installed

Ordering Information

Macintosh PowerBook 3400c/180

Mac OS Computers on a TCP/IP Network (2/97)

Revised: 2/10/97
Security: Everyone

Mac OS Computers on a TCP/IP Network (2/97)

Article Created: 10 February 1997

TOPIC -----

I just purchased a Mac OS-based computer. I am hooking up to my Ethernet network and want to communicate with other computers that are not running the Mac OS. The computers on my network use TCP/IP. I setup my TCP/IP control panel but I do not see any zones in the chooser. Also, when I click on AppleShare in the chooser, I do not see any computers.

DISCUSSION -----

Without adding third-party software to your Mac OS computer, the information you see in the chooser is for computers which communicate with the AppleTalk protocol. For example, if you click AppleShare in the chooser, it looks for other computers on your network that are using the AppleTalk protocol and are "AFP" (Apple Filing Protocol) services. An AFP service may be another Mac OS computer using personal file sharing, an AppleShare file server, or any server that communicates using AppleTalk that provides AFP services.

If the computers on your network use TCP/IP, there are other ways to "see" the these computers using third-party software. Some of the utilities you may use include (but are not limited to) MacTCP Ping, MacTCP watcher, MacPing. These utilities let you "ping" another IP addresses on the network.

NOTE: ping is a command which sends simple TCP/IP packets to a computer to determine whether or not the computer is functioning on the network.

Many TCP/IP computers exchange files using FTP (file transfer protocol). If computers on your network use ftp, your Mac OS computer can use third-party software like Fetch to exchange files.

Revised: 2/10/97
Security: Everyone

AIX: .profile Not Sourced in CDE (2/97)

=====

Article Created: 10 February 1997

TOPIC -----

I just installed CDE on AIX and my .profile is not being sourced "run" when I login to CDE.

DISCUSSION -----

When CDE starts a shell, it will no longer source .profile. It will source .dtprofile located in the same directory as your .profile.

If you would like your .profile to be sourced, you need to uncomment the last line in you .dtprofile by removing the "#" from the line:

```
DTSOURCEPROFILE=true
```

Power Macintosh 4400/200: Memory Expansion (3/97)

Revised: 3/5/97
Security: Everyone

Power Macintosh 4400/200: Memory Expansion (3/97)

Article Created: 11 February 1997
Article Reviewed/Updated: 5 March 1997

TOPIC -----

What type of memory is supported in the Power Macintosh 4400 series computers?

DISCUSSION -----

The Power Macintosh 4400/200 computer does not have any DRAM memory soldered on the logic board. All RAM expansion is provided by DIMMs installed in any of the three 168-pin DIMM sockets. DRAM expansion slot 1 supports single-bank DIMMs (a maximum of 32 MB). DRAM expansion slots 2 and 3 support both single-bank and dual-bank DIMMs (a maximum of 64 MB per slot with dual-bank DIMMs). A total of 160 MB of DRAM is supported.

The RAM expansion slots accept the following DIMM types:

- * 168-pin 3.3-volt EDO (Extended Data Out) DIMMs
- * 64-bit wide
- * Acceptable DIMM sizes include 8, 16, 32, and 64 MB.

IMPORTANT: The Power Macintosh 4400/200 uses 3.3-volt EDO DIMMs, which are NOT compatible with the Macintosh Performa 6400 and Power Macintosh 5500 and 6500 computers. Although these other computers also may support the use of EDO DIMMs, they require 5-volt EDO DIMMs.

Also, the Power Macintosh 4400 does NOT support the use of Fast-Page-Mode (FPM) memory.

For additional information about EDO memory and its benefits, using the search string, "edo and memory" to locate a related article titled, "Power Macintosh Computers: Using FPM, EDO, SDRAM, & SGRAM."

PC Compatibility Card: Drive Container Size Limit (2/97)

Revised: 2/25/97
Security: Everyone

PC Compatibility Card: Drive Container Size Limit (2/97)

=====

Article Created: 11 February 1997
Article Reviewed/Updated: 25 February 1997

TOPIC -----

When I create a 2 GB drive container for use with the PC Compatibility Card, the PC crashes and other problems occur. If the drive container is only 500 MB, everything works fine. What is wrong?

DISCUSSION -----

Only drive containers that are 1023 MB or less are supported. Any drive container larger than 1023 MB could cause your machine to crash when it is in the PC environment.

Open Transport AppleTalk: Needs Assistant Toolbox v1.3 (2/97)

Revised: 3/19/97
Security: Everyone

Open Transport AppleTalk: Needs Assistant Toolbox v1.3 (2/97)

=====

Article Created: 11 February 1997

TOPIC -----

This article discusses an incompatibility between Open Transport AppleTalk and early versions of the Assistant Toolbox turning off AppleTalk when you restart your computer.

DISCUSSION -----

Open Transport is incompatible with all Assistant Toolbox versions prior to version 1.3. If you are using Mac OS 7.5.x and AppleTalk is off every time you restart your computer, check the version of Assistant Toolbox installed in your Extensions folder. You can install Assistant Toolbox v1.3 using the System 7.5 Update 2.0 Custom Install option.

If you need help checking the version number, see the section Checking the Assistance Toolbox Version.

If you are using Mac OS 7.6 or later, Assistant Toolbox is built into Mac OS 7.6, so you do not have to check the version. However, if you have a version of Assistant Toolbox installed with Mac OS 7.6, throw it away.

Checking the Assistant Toolbox Version
=====

Step 1

Open the System folder.

Step 2

Open the Extension folder.

Step 3

Click once on the Assistant Toolbox extension.

Step 4

Select Get Info from the File menu (CMD-I).

Open Transport Access to AppleTalk Network Alert (2/97)

Revised: 2/12/97
Security: Everyone

Open Transport "Access to AppleTalk Network" Alert (2/97)

=====

Article Created: 12 February 1997

TOPIC -----

Since installing Open Transport, we have users getting intermittent messages indicating that access to their AppleTalk network has become unavailable. Subsequently they get a similar message indicating that access to their AppleTalk network has become available. What generates these messages?

DISCUSSION -----

These are messages are generated when a Macintosh computer is unable to communicate with its router. This usually indicates a routing device on the network which is not configured properly, or marginal network wiring. In either case, network administrators will need to investigate and resolve the root cause.

As an interim measure to reduce occurrences of these alert messages, the AppleTalk Options control panel can be installed. This control panel has the option to suppress router related alerts. It is intended for use by ISDN users who have connections which go up and down as needed by network traffic.

CAUTION: The AppleTalk Options control panel should not be used as a long term solution for Macintosh computers receiving router alerts on routed networks.

The AppleTalk Options control panel can be found in the Open Transport Extras folder with Open Transport 1.1.1 and later.

Tips

- Improving Video Capture
- Improving the Quality of Audio CD Recordings
- Allocating More Memory to Application Programs
- Using the Recent Documents Command in the Apple Menu
- Installing Acrobat Reader Software from the System Software CD
- Reinstalling or Removing Zip Drive Software
- Removing the 9600 Graphics Accelerator
- Installing and Removing PCI Cards

Important Information About Desktop Printing

- Creating Desktop Printers
- Printing With a Desktop Printer
- Selecting a Default Printer
- Working With Desktop Printer Icons
- Managing Printing
- Turning Off Desktop Printing
- Support and Compatibility Information
- Troubleshooting Tips

Tips

====

Improving Video Capture

To increase the speed and quality of video captures on Power Macintosh models that support video capture, follow these guidelines:

- * Turn off virtual memory in the Memory control panel.
- * In the Monitors & Sound control panel, set the color depth to Millions. (The Millions setting may not be available until you select a smaller screen resolution setting first.)
- * Turn off AppleTalk. (You can quickly turn AppleTalk on or off with the Control Strip, or use the Chooser instead.)
- * Turn off the Menubar Clock in the Date & Time control panel.
- * Turn off all unnecessary extensions. Do not turn off QuickTime. (Use the Extensions Manager control panel to turn off extensions; then restart your computer.)
- * If you have installed Apple VideoPhone, remove the "QTCCComponentDV" extension from the Extensions folder inside your System Folder, and then restart. (The "QTCCComponentDV" video digitizer extension is optimized for video conferencing, but your Power Macintosh contains equivalent software that is optimized for video capture.)
- * Do not run programs other than the capture application while capturing video.
- * Reduce the size of the capture window. (160x120 is the best size; also, 320x240 is good.)
- * Make sure that your hard disk has enough free space to record. If you notice a decline in performance, use a disk optimizer to improve your disk's efficiency.
- * Make sure that the application program you use for capturing video has enough extra memory allocated for one second of video at the size and bit depth that you are using to record. For example, to record 30fps at 320x240 in millions of colors requires at least 4500K (4.5 MB) free in the application partition. About This Macintosh (in the Apple menu) lets you estimate memory usage.
- * Do not allocate all of the available memory to the capture application. When your capture application is running, you should have an unused block size of at least 500K in About This Macintosh.

When working with applications that support adjusting video and sound settings, the following settings allow the highest video capture performance:

- * Use the Component Video video compressor. Do not use post-compression.
- * Set sound input sampling to 16 bits, stereo, and 44.1KHz. Do not use a sound compressor.

Improving the Quality of Audio CD Recordings

You can use the AppleCD Audio Player and SimpleSound (both available in the Apple menu) to record from an audio CD to a file on disk. If your recordings

sound distorted when you play them, try lowering the volume level in the AppleCD Audio Player and record the sound again.

Usually, you should get acceptable results when the volume is set to about the middle level. However, you may want to experiment with different volume settings; because audio CDs are recorded at various sound levels, individual CDs may require a different setting for optimal recording.

Allocating More Memory to Application Programs

If you are having new problems with application programs reporting that they do not have enough memory, System 7.5.5 may require programs to use an additional 23K of memory. To fix the problem:

1. Quit the program if it is open.
2. Click the program's icon to select it.
3. Open the File menu and choose Get Info.
4. In the Info window, increase the value in the "Preferred size" box by 23.
5. Close the window.

Using the Recent Documents Command in the Apple Menu

You can easily open any of your most recently used documents by choosing the Recent Documents command in the Apple menu, then choosing a document from the submenu. However, this feature can increase the time it takes to open some applications. This occurs because the recent-documents tracking includes all files that are opened--even those opened by an application as part of its launch sequence (such as drop-in filters used by desktop publishing packages). You can reduce the increased opening time by turning off the recent-documents tracking. You can either:

- * turn off "recent documents" tracking in the Apple Menu Options control panel
- * turn off Apple Menu Options in the Extensions Manager

Installing Acrobat Reader Software from the System Software CD

To install Acrobat Reader software from the system software CD onto your hard disk, make sure that the system software CD that came with your computer is not the startup disk. Then locate the Acrobat Reader folder on the CD and follow the installation instructions.

Note: To make sure that the system software CD is not the startup disk, shut down your computer. Then start up the computer while pressing the eject button on the CD-ROM drive (the disc is ejected). After the computer restarts, reinsert the CD and install the Acrobat Reader software.

Reinstalling or Removing Zip Drive Software

Some Power Macintosh models come with an internal Zip drive. Normally when you insert a Zip disk into this drive, an icon for the Zip disk appears on the Macintosh desktop. If an icon for the inserted disk does not appear on the desktop, the Iomega Driver in your System Folder may be missing or damaged. You can reinstall the Iomega Driver by following these steps:

1. Insert the system software CD-ROM disc that came with your computer.
2. Open the Iomega Tools folder in CD Extras folder on the CD-ROM disc.
3. Drag the Iomega Driver icon to the System Folder icon on your hard disk.

One or more alert messages may appear. One will ask if you want to store the Iomega Driver in your Extensions folder, and another may ask if you want to replace a file that already exists.

4. Click the OK button in these alert messages.
5. Eject the CD-ROM disc. (Select the disc icon and choose Put Away from the File menu.)
6. Restart your computer.
7. Try inserting a Zip disc again.

Though only some Power Macintosh models include an internal Iomega Zip drive, your model includes Iomega software on your hard disk, even if your model does not come with a Zip drive.

If your Power Macintosh model does not include a Zip drive, you can remove this software if you wish. (Or you may also wish to keep this software in case you later purchase and connect a Zip drive.) Removing the software frees up disk space and makes your computer start up slightly faster. If you ever need to reinstall the Iomega software, it is available on the CD-ROM disc that comes with your computer.

To remove the Iomega software, drag the following icons to the Trash:

- * Iomega Driver (located in the Extensions folder inside your System Folder)
- * Iomega Tools folder (located in the Apple Extras folder)

Removing the 9600 Graphics Accelerator

When you turn on your computer, icons appear along the bottom of the screen to indicate which system software extensions are being loaded during startup. On Power Macintosh 7300, 7600, and 8600 models, this extension may appear with a red "X" through it.

This "9600 Graphics Accelerator" extension file is only required for use on Power Macintosh 9600 models that contain the optional video card. If you are using a Power Macintosh other than the 9600 model, you can delete this extension file if you wish. To delete the "9600 Graphics Accelerator" extension (located in the Extensions folder inside your System Folder), drag its icon to the Trash.

Installing and Removing PCI Cards

Your Power Macintosh User's Manual contains detailed instructions about installing peripheral component interconnect (PCI) expansion cards. Follow these instructions carefully when installing a PCI card. To avoid damaging the PCI slot when you install or remove a PCI card, do the following:

- * Do not rock the card from side to side; instead, press or pull the card straight into or out of the slot.

* Do not physically insert or remove two cards at the same time; insert or remove each card individually.

Important Information About Desktop Printing

=====

This document contains information about using the desktop printing feature on your computer.

With desktop printing, a printer icon is created on your desktop whenever you select an Apple LaserWriter or StyleWriter printer in the Chooser. You can use these "desktop printer" icons to print documents and manage printing.

With desktop printing, you can

- * print a document in the Finder by dragging it to a desktop printer icon
- * select the default printer without opening the Chooser
- * manage and schedule printing documents

IMPORTANT Desktop printing works with Apple StyleWriter printers, Apple LaserWriter printers, and many other PostScript printers. Desktop printing does not work with other types of printers and Fax Sender.

Creating Desktop Printers

To create a desktop printer, follow these steps:

1. Open the Chooser.
2. Select the print driver for the printer you are using.
3. Select the printer you want to use.
4. Close the Chooser.

When you close the Chooser, an icon for the printer appears on the desktop. The name of the icon is the name of the printer. The name of the printer also appears in the Printer menu to the left of the Guide menu and in the Desktop Printers item in the Apple menu.

After the desktop printer icon appears, you can move it to any location on your startup disk.

You can have as many desktop printers as you want. To create other desktop printers, you must open the Chooser, select the printer, and close the Chooser for each printer you want to use.

The last printer you select in the Chooser becomes the default printer. The default printer is used whenever you choose Print from the File menu. The desktop printer icon for the default printer has a bold outline. For other ways to select the default printer, see "Selecting a Default Printer" later in this document.

Note: If you use different versions of the LaserWriter 8 software to print to the same printer, you can create a desktop printer icon for each version of the LaserWriter software. For example, you might use LaserWriter driver version 8.4.1 for printing and version 8.2.2f for faxing. To create a desktop printer

for each driver, select the LaserWriter 8.4.1 driver and your printer in the Chooser, then close the Chooser. Reopen the Chooser and select the LaserWriter 8.2.2f driver and your printer, then close the Chooser. To choose which version of the driver to use, change the default printer (see "Selecting a Default Printer"). To avoid confusion, rename the desktop printer icons to indicate which version of the printer software the icon uses.

Printing With a Desktop Printer

You use desktop printers to print documents from the Finder. Using desktop printers, you can print several documents at the same time, including documents created with different programs. (You can still print documents from within applications using the Print command in the File menu.)

To print documents with a desktop printer, follow these steps:

1. Select the icons of the documents you want to print.
2. Drag the documents to the icon of the desktop printer you want to use.

Note: When you drag a document to a desktop printer, that printer becomes the default printer.

The document opens and the Print dialog box appears.

3. Choose your printing options, then click the Print.

Selecting a Default Printer

The default printer is the printer you use when you choose Print from the File menu.

To change the default printer, you can do the following:

- * Print documents from the Finder with a desktop printer icon.
- * Select a desktop printer icon and choose Set Default Printer from the Printing menu.
- * Choose the printer from the Printer menu that appears to the left of the Guide menu.
- * Select the printer name using the Printing module in the Control Strip.
- * Select a new printer in the Chooser.

Note: Changing the printer you are using may change how much information appears on a page of your document. If you change printers, check the formatting of your document.

Working With Desktop Printer Icons

Desktop printer icons show the status of the printer.

You can rename desktop printer icons, make aliases of them, and throw them away, just like other Finder icons.

Note: You can't throw away a desktop printer icon while the printer is printing a document.

If you throw away the icon for the default printer, another desktop printer is automatically selected as the default printer. If you do not have another desktop printer another icon is automatically created for the desktop printer you are throwing away. To throw away the last desktop printer icon, you must select a printer in the Chooser that does not support desktop printing.

Managing Printing

If background printing is turned on for the printer you are using, you can use desktop printing to manage print jobs. You perform tasks with the Printing menu that appears when you select a desktop printer. You perform other tasks by using the desktop printer window that opens when you double-click a desktop printer icon.

To manage printing using the Printing menu

The Printing menu appears to the right of the Special menu when you select a desktop printer icon.

Using the Printing menu you can do the following:

- * Choose Start Print Queue to restart printing.

Note: You need to choose Start Print Queue to restart printing if you click the Stop Queue button in a printer alert message.

- * Choose Stop Print Queue to stop printing all of your documents. The icon of the printer indicates that you have stopped printing.

- * Choose Get Printer Info to see information about the printer. (Only available for some printers.)

- * Choose Change Setup to change the setup of the printer. (Only available for some printers. You can change the setup of other printers using the Chooser.)

- * Choose Show Manual Feed Alert to turn the manual alert on or off.

- * Choose Set Default Printer to select the printer as the default printer, if it isn't selected already.

To manage printing using the desktop printer window

Double-click a desktop printer icon to open its window.

The name of the document currently printing and status messages about the current print job appear in the upper box. The status messages can help you troubleshoot a printing problem.

When you are printing more than one document, a list of the print jobs appears in the lower box. If this list is sorted by the Print Time column, it shows the order in which the documents will be printed.

Using the desktop printer window, you can do the following tasks:

- * To change the sort order of the print job list, click the title of the column by which you want to sort. The column title by which the list is sorted is underlined. For example, to sort by the name of the document, click Document Name.

Note: Changing the sort order of the print jobs does not change the order in which they will print. To see that order, click the Print Time heading.

- * To cancel printing a document, select the print job in the list and click the Remove button. You can also drag the print job from the window to the Trash icon on the desktop.

Note: These methods do not delete the document itself.

- * To put printing a document on hold, select the print job in the list and click the Hold Job button. You can also put the document that's currently printing on hold by dragging it to the print job list.

- * To resume printing a document, select the print job and click the Resume Job button.

- * To print a document immediately, select the print job and put it on hold. Next, click the Set Print Time icon button and select Urgent in the dialog box that appears, then click OK. You can also drag the print job to the top of the print job list or to the area reserved for the currently printing job.

- * To schedule printing, select a print job and click the Set Print Time button. In the Set Print Time dialog box, click At Time and set the time you want. Then click OK.

- * To change the print order, drag the name of a print job up or down in the print job list.

- * To print the document using another desktop printer, drag the print job to the icon of the other desktop printer. That printer becomes the default printer. You can only move a print job to another printer of the same type. For example, you can't move a print job from a LaserWriter printer to a StyleWriter printer.

- * To stop printing all documents, hold down the Option and Shift keys and click the Hold Job button. You can also choose Stop Print Queue from the Printing menu.

- * To start printing documents, hold down the Option and Shift keys and click the Resume Job button. You can also choose Start Print Queue from the Printing menu.

Turning Off Desktop Printing

If you don't want to use desktop printers, you can turn off Desktop PrintMonitor using the Extensions Manager control panel.

IMPORTANT Before you turn off Desktop PrintMonitor, be sure that all documents have finished printing. If there are documents waiting to print that you do not want to print, you can cancel printing as described in the previous section on this document.

To turn off Desktop PrintMonitor, follow these steps:

1. Open the Extensions Manager control panel.
2. Click the boxes next to these extensions to remove the X:
 - * Desktop PrintMonitor
 - * Desktop Printer Extension
 - * Desktop Printer Spooler
 - * Desktop Printer Menu extensions
3. Click the close box to close the control panel.
4. If your computer has a Control Strip, drag the Printer Selector file from the Control Strip Modules folder in the System Folder to the Trash.
5. Restart your computer.

Support and Compatibility Information

* Some third-party printers do not support desktop printing. If no desktop printer icon is created after you select your printer in the Chooser, it is likely that your printer does not support Desktop PrintMonitor. Please contact the vendor of your printer to see if there is a version of the print driver that is compatible with Desktop PrintMonitor.

* When you choose Save or Open in an application and look at files and folders on the desktop, desktop printers appear in the list as if they are folders. Do not save documents in a desktop printer "folder." If you do, you will not be able to access the document in the Finder.

IMPORTANT If you save a document in a desktop printer "folder," use the Save As command to save the document in a different location as soon as possible.

Note: You cannot remove a document that you save in a desktop printer icon. If you want to delete the document, throw away the desktop printer icon and select the printer in the Chooser again.

* Desktop PrintMonitor supports drag-and-drop printing for all files that cause the Print command in the File menu to become available. Since clipping files do not make the Print command available, they cannot be dragged to a desktop printer icon for printing.

* Apple's Fax Sender software is not supported by Desktop PrintMonitor. Fax

Sender is fully functional when Desktop PrintMonitor is installed; however, it does not use Desktop PrintMonitor's features.

IMPORTANT When you select Fax Sender in the Chooser, you will not have a default desktop printer until you select a printer icon and choose Set Default Printer from the Printing menu.

Troubleshooting Tips

Problem: When you try to print, the spool file for the print job is moved to the Trash and an alert message appears saying that the desktop printer could not be found.

Solution 1: It's possible that the desktop printer icon is damaged. To fix this, drag the desktop printer icon to the Trash and reselect the printer in the Chooser. A new desktop printer icon will be created.

Solution 2: If your printer software is not published by Apple Computer or Adobe Systems, it may not be compatible with Desktop PrintMonitor. If this is the case, turn off Desktop PrintMonitor (as described earlier in this document) and use an older version of PrintMonitor.

Problem: When you drag documents created by different software applications to your desktop printer icon, a message appears that says there is not enough memory to continue.

Solution: Because the application used to create a document opens when you print the document, your computer must have enough random-access memory (RAM) available to open all of the programs for the documents you are printing. To resolve this situation, print your documents individually or in smaller groups.

Problem: You are using a LaserWriter 300 and the "Out of Paper" message doesn't go away automatically after you add paper to the printer.

Solution: If you are using Desktop PrintMonitor with the LaserWriter 300 driver, the "Out of Paper" message will not go away automatically after you add paper to the printer. The only way to work around this problem is to turn off Desktop PrintMonitor as described earlier in this document and use an older version of PrintMonitor.

Problem: Documents printed on a Color StyleWriter do not have the correct colors after you put printing on hold and then resumed printing.

Solution: To avoid this problem, always resume printing on page one.

Troubleshooting

=====

For more troubleshooting information on the problems described below and other topics, refer to Macintosh Guide online help (available in the Guide menu when the Finder is active) and the manual that came with your computer.

Printing Problems

Problem: You have trouble printing on a StyleWriter or StyleWriter II printer.

Solution: If you use a StyleWriter or StyleWriter II printer with your computer, use the StyleWriter 1200 printer driver that came installed on your computer. Do not install your older StyleWriter driver.

Problem: You see a low-memory warning when you print Stickies on a StyleWriter, StyleWriter II, or StyleWriter 1200 printer.

Solution: This problem can occur when the amount of memory Stickies uses is set below 150K. Try increasing the amount of memory available to Stickies. For instructions on changing the memory a program uses, refer to Macintosh Guide, available from the Guide menu when the Finder is active. To locate the Stickies application program so you can increase its memory, open the System Folder, then look in the Apple Menu Items folder (inside the System Folder).

Problems with Sound

Problem: When you play back sound you've recorded, you notice clicks, pops, or skips.

Solution: This problem can occur if you have virtual memory turned on while you're recording sound. Turn off virtual memory before recording. For instructions on turning off virtual memory, refer to Macintosh Guide, available from the Guide menu when the Finder is active.

Problem: Adjusting the volume slider in Apple Video Player and other sound applications does not affect the volume, or turns the volume all the way up or all the way down (no in-between settings).

Solution: This problem occurs on some newer models that handle sound differently from some application programs. You can use the system sound settings to adjust the volume. Follow these steps:

1. Open the Apple (*) menu and choose Control Panels.

2. Open the Monitors & Sound control panel.
3. Click the Sound button.
4. Use the volume or level slider (whichever is available) to adjust the sound volume.

Problem: Your program requires the Sound control panel to set sound options.

Solution: Some application programs that use sound require the Sound control panel, an older control panel that has been replaced on your computer by the Monitors & Sound control panel.

The Sound control panel is located in the Apple Extras folder on your hard disk and in the CD Extras folder on the system software CD that came with your computer. To install it, drag it to the System Folder on your hard disk and then restart your computer.

Note: You can also install the Sound control panel by doing a custom installation of system software. For instructions, refer to the information on doing a custom installation in the Troubleshooting chapter of the manual that came with your computer. When the Custom Install dialog box appears, click "Sound control panel" in the list, then click Install.

Networking and File Sharing Problems

Problem: AppleShare displays incorrect information for large drives.

Solution: If you use File Sharing to share a disk larger than 2 gigabytes (GB), some older computers connected to your computer may display an incorrect size for the disk in the Get Info box. (Get Info reports the disk to be 2 GB in size, even if it is larger.) Because these older computers do not support the larger drives, they also cannot report correct information about the drives. (Computers with System 7.5 display correct information.)

Problem: You can't reconnect to a server.

Solution: If you unexpectedly lose a connection to a server on which you have items in use, and then choose the server from the Recent Servers item in the Apple menu, you get a message that the disk could not be opened because you do not have enough access privileges or because the server can't be found on the network. Before you can reconnect to the server, you must close any open files. If you need to save work in a file, use Save As to save it on a different disk.

Problem: You have problems using AppleShare Server Software version 4.1 or 4.2.

Solution: AppleShare server software versions 4.1 and 4.2 are not intended for use with PCI-based computers, including Power Macintosh 7300, 7600, 8600, and 9600 computers. If you attempt to use AppleShare server software version 4.1 or 4.2 with these models, you may experience problems.

Problems Using a RAM disk

Problem: You see a message that your RAM disk is unreadable.

Solution: Under some circumstances you may see the following message after setting up a RAM disk:

"This disk is unreadable by this Macintosh. Do you want to initialize the disk?"
(Important: This message applies to the RAM disk, not to your hard disk, which

will not be initialized.)

Decrease the size of the RAM disk. If you see the message again, decrease the size again. Continue to decrease in small amounts until the message no longer appears.

Compatibility Problems

=====

Adobe Premiere

Turn off virtual memory, make AppleTalk inactive, and restart your computer prior to installing Adobe Premiere Deluxe. Otherwise the mouse may freeze during installation. You turn off virtual memory in the Memory control panel. You make AppleTalk inactive in the Chooser or in the AppleTalk control panel. For instructions, refer to Macintosh Guide, available from the Guide menu when the Finder is active.

Aladdin DesktopTools

One feature of Desktop Shortcut, a component of the Aladdin Desktop Tools 1.0.2, is known to fail. If Shortcut is installed, when you are in an Open or Save dialog box, normally you can click in any window in the Finder. The files/folders in that window will then appear in the Standard File Dialog box's scrolling list. To work around this problem, navigate using the Shortcut Menu icon. Aladdin Systems <<http://www.aladdinsys.com>> has been contacted about this problem and expects to release an update in the future to address the issue.

Apple PC Compatibility Card

If you purchase and install an Apple PC Compatibility Card and the PC Compatibility Software version 1.5 on a Power Macintosh 7300, you should reinstall the PC Exchange software from the CD-ROM disc that came with your Power Macintosh. The PC Compatibility Software includes PC Exchange 2.0.7, which is not compatible with Power Macintosh 7300 models.

The system software CD-ROM disc that came with your computer contains PC Exchange 2.0.5, which is compatible with Power Macintosh 7300 models. The features that were added to PC Exchange 2.0.7 are now part of other system software components, so you will not lose any features or functionality by installing the older 2.0.5 version of PC Exchange.

To install PC Exchange 2.0.5, do the following:

1. Follow the instructions in your user's manual to perform a custom installation of system software.
2. When you see the Custom Install dialog box that lists all the available system components, click the triangle next to the "Compatibility Software" listing, and click the checkbox next to PC Exchange.
3. Follow the remaining custom installation steps in your user's manual to complete the installation.
4. You may see an alert warning that you are replacing a newer version with older software. Click the "Older" button to proceed with the installation of the older version of PC Exchange.

AppleShare and Connectix Speed Copy

There is an incompatibility between AppleShare Workstation software version 3.6.1 and Connectix Speed Copy (part of Speed Doubler version 1.1 or earlier). Use the Extensions Manager to turn off Speed Copy before you install this system software version, and contact Connectix to get the latest version of Speed Doubler. (You can contact Connectix at <http://www.connectix.com>, 415-571-5100, or 800-950-5880.)

Conflict Catcher

When using Conflict Catcher, a disabled extension may be moved to the top level of your hard disk. If this happens and you try to turn on the extension in the Extensions Manager control panel, you will not be able to turn it on, even though it appears in the list. To fix this problem, drag the desired extension into the "Extensions (Disabled)" folder (in the System Folder) before using the Extensions Manager.

Energy Saver control panel

The Energy Saver control panel is known to interrupt the play of audio CDs if "Shutdown instead of sleep" is selected. To avoid this problem, uncheck "Shutdown instead of sleep" in the Energy Saver control panel.

FWB Hard Disk ToolKit

If you are using a Power Macintosh model with an internal Zip drive and Hard Disk ToolKit is installed, you may see an alert message stating that the Iomega driver could not load because another driver is already controlling the drive. To prevent this message from appearing, do the following:

1. Open the Hard Disk ToolKit Extension Configuration application.
2. Turn off the "Check All SCSI Addresses" option.
3. Turn on individual checking for each SCSI ID except for SCSI ID number 5, which is the default SCSI ID for the Zip drive.
4. Restart your computer.

Hypercard 2.3.3 or earlier

The Hypercard Audio Palette does not record sound properly. To correct the problem, update to Hypercard 2.3.5, or use another sound recording application program such as SimpleSound to record sounds and then import them into Hypercard. You can download a Hypercard 2.3.5 updater from the Apple World Wide Web site <<http://www.apple.com>> or America Online. It will update Hypercard 2.3 or later to version 2.3.5.

Japanese and Chinese Language Kits

To use the Japanese Language Kit with your computer, you must install version 1.2 or later. In the United States, you can obtain an upgrade by calling Claris at 1-800-293-6617.

To use the Chinese Language Kit with your computer, make sure you use version

1.1.1 or later. To install the Chinese Language Kit version 1.1.1, follow these three steps:

1. Install the WorldScript Updater 1.0.
2. Install the Chinese Language Kit version 1.0 or 1.1.
3. Install the Chinese Language Kit Updater to update your software to version 1.1.1.

IMPORTANT: Be sure to follow the steps in the order shown.

Microsoft Office

If you are using Microsoft Office 4.2.1, you may need the "Office 4.2x Update For Power Mac" version 1.0.1 extension, and the "Microsoft Office Manager Updater" version 4.2.1c. These files are available from the Microsoft World Wide Web site at <<http://www.microsoft.com>>. Download the MC1164.HQX and MOMUPDAT.HQX files.

Motorola Math Library and Connectix Speed Copy 1.3.1

There is a known incompatibility when these two products are used at the same time: the Motorola Math Library and Connectix Speed Copy 1.3.1 (part of Speed Doubler 1.3.1). If you have both of these items in the System Folder, Speed Copy 1.3.1 cannot be used. In order to use Speed Copy, remove the Motorola Math Library from the Extensions folder and restart your computer.

Novell Netware

The Ethernet Compatibility extension version 1.0.3 is installed with this system software to fix a problem in the system shutdown code that affected PCI computers connected to certain networks, such as Novell Netware. A side effect of this fix is a two-minute delay in shutting down the computer.

QuarkXPress

To use QuarkXPress on a PowerPC-based Macintosh computer, you must upgrade to QuarkXPress version 3.3.2 (or later).

Sagem GeoPort ISDN Adapter 1.0

There is a known incompatibility with the Sagem GeoPort ISDN Adapter 1.0, resulting in the inability to use the GeoPort ISDN Adapter. Sagem has been contacted about this problem and is working on a solution. For more information, visit the Sagem web site at <http://www.satusa.com>.

Important Information About Virtual Memory

=====

Virtual memory (VM) is a feature of the Macintosh that lets you use part of your hard disk as additional memory. If you are using an application program designed especially for Power Macintosh computers (often called a "native" application program), turning on virtual memory lets your application use less memory.

With virtual memory turned on, a Power Macintosh program uses less memory than

when virtual memory is turned off. If you check the program's Get Info box before and after turning on virtual memory, you'll see that the numbers in the Memory Requirements box change. That is because turning on virtual memory allows the program to use memory more efficiently.

If you notice performance problems (such as your computer's responses seeming unusually slow) using certain application programs, you may want to turn off virtual memory.

For information on how to turn virtual memory on and off, choose Macintosh Guide from the Guide (question mark) menu, and click the Memory topic area. For best performance, try setting virtual memory to no more than 150% of the random-access memory (RAM) installed in your computer, or no more than 50% of your currently available hard drive space, whichever number is lower. For example, if your computer has 16 MB of RAM and your hard drive has 50 MB of available space, set virtual memory to a maximum of 24 MB (this is 150% of your 16 MB of RAM, and less than 50% of the available space on your hard drive).

To improve performance, you can also add memory (RAM) to your computer. See the user's manual that came with your computer for more information.

Important Information About Document Auto-Save

=====

The Energy Saver control panel contains a feature named "Document Auto-Save." The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Macintosh (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When an application is incompatible with Document Auto-Save, it will either not automatically quit, or it displays alerts or dialog boxes which Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave no documents open that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel to sleep instead of shutting down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Macintosh Guide from the Guide (question mark) menu, and choose the Energy Saving topic area.

Other Document-Saving Products

There are conflicts when non-Apple document-saving control panels or extensions are used in conjunction with Energy Saver's Document Auto-Save. For best results, use the document-saving features of only one control panel or

extension.

Self-Dismissing Dialogs

Under some rare conditions, the Energy Saver control panel may continuously dismiss dialog boxes if the Document Auto-Save feature unexpectedly fails during an idle or scheduled shutdown. (Whenever a dialog box appears, it is dismissed as if you have pressed the Return key.) To return things to normal, simply click the mouse button or press the space bar.

Important Information About Macintosh PC Exchange

=====

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a MacOS-based computer, you must decompress the files and save them to a noncompressed DOS-format floppy disk.

Working With Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use PC Exchange to mount the MacOS-, DOS-, or ProDOS-format partitions as individual volumes on the Macintosh desktop. If the disk contains both MacOS- and DOS-format partitions, PC Exchange will recognize only the MacOS partition. In addition, PC Exchange will recognize ProDOS-format partitions only on SCSI hard disks that are less than 32 megabytes.

You can use PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge if they have the same format. However, you cannot use PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a MacOS-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple MacOS, DOS, or ProDOS partitions, you need to use third-party software designed for partitioning hard disks and removable media cartridges.

Working with DOS-Format SCSI Removable Media Devices

In order for PC Exchange to recognize any SCSI removable media device, you must turn on the device and eject any cartridges before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. PC Exchange will install its own device driver for that SCSI device.

The Eject Disk command is unavailable when you are working with removable media devices. To unmount and eject a removable media cartridge, drag the device's icon to the Trash. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply reinsert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on a DOS or

DOS-compatible computer, use the disk setup and partitioning software that came with the SCSI controller card installed in your PC or that came with your Bernoulli or SyQuest device. (Do not use the MS-DOS FDISK command.) Also, use the MS-DOS FORMAT command to format a newly initialized removable media cartridge on a DOS or DOS-compatible personal computer (PC) before you copy DOS files onto it.

When you initialize a removable media cartridge on a DOS or DOS-compatible PC, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media drive. If you do not, PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Working with DOS-Format SCSI Hard Disk Drives

In order for Macintosh PC Exchange to recognize a SCSI hard disk drive, you must turn on the drive before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. PC Exchange will install its own device driver for that SCSI device.

When initializing and formatting an external SCSI hard disk connected to a DOS or DOS-compatible PC, use the MS-DOS FDISK command or the disk setup and partitioning software that came with the SCSI controller card installed in your PC. In addition, you should use the MS-DOS FORMAT command to format and erase the disk before you copy DOS files to a new SCSI hard disk connected to a PC.

Tips and Problems

* A "Sad Mac" icon may appear on your screen at startup if a removable media cartridge has been left in the drive. To keep this problem from occurring, manually eject removable media cartridges from their drives before you turn on your computer.

* Macintosh PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files that contain more than one gigabyte of disk space.

7.5.5 SCSI Server Update Read Me (4/97)

Revised: 4/23/97
Security: Everyone

7.5.5 SCSI Server Update Read Me (4/97)

Article Created: 13 February 1997
Article Reviewed/Updated: 23 April 1997

TOPIC -----

This article is the 7.5.5 SCSI Server Update ReadMe file.

DISCUSSION -----

7.5.5 SCSI Server Update

This extension has been created to resolve a bug that could cause a server to hang when a client computer performed a find file search on a server volume. This extension is only for use on PowerPC Apple Workgroup Servers running AppleShare 4.2.x and System 7.5.5.

This is intended for use with PowerPC NuBus- and PCI-based Workgroup Servers, AppleShare 4.2.x, System Software version 7.5.5, and Open Transport 1.1.1. They have undergone extensive testing and together are fully compatible. Installation of the PowerPC Interrupt Extension is also recommended.

NOTE: 7.5.5 SCSI Server Update is designed for use only with System 7.5.5, and only with Apple Workgroup Servers. Customers with computers that are not Apple Workgroup Servers will receive no benefit from installing this extension.

IMPORTANT:

It is important that the instructions provided in this document are followed in the order written. If you encounter problems with this installation, you may have to perform a clean System Software installation and reinstall all of the listed software in the order presented below.

Instructions for installing 7.5.5 SCSI Server Update 1.0

1) As a precaution, Apple recommends performing a complete backup of the server

volumes with a third-party backup utility before installing this patch.

2) Locate your "Workgroup Server Software" CD-ROM disc. Boot the Macintosh or Workgroup Server from the bootable CD by holding down the C-key while the server is starting up. You can verify that the CD is the boot volume by checking for its icon in the uppermost position on the desktop.

3) Use the Disk First Aid program to verify and, if necessary, repair all volumes. Disk First Aid should be run from the CD (located in the Utilities folder on most System Software CD-ROM discs). Do not install this patch if any drive cannot be repaired.

4) Install the Mac OS System Software 7.5.5 Update.

If you do not have this patch, you can download it from
<http://www.info.apple.com/swupdates/>

The software is located at the following path:

US

Macintosh
System

NOTE: Please read the Read Me files that are included with all system software patches to ensure installation is performed correctly. Note that "SCSI Update 1.0" requires Mac OS 7.5.5 to be running on the computer.

5) Install Open Transport 1.1.1 if it is not already installed. Use Network Software Selector to switch over to Open Transport. (This is located in your Apple Extras folder.)

6) Install the 7.5.5 SCSI Server Update extension by dragging it to a closed System Folder. Click OK when asked to place the extension in the Extensions folder.

7) Install the PowerPC Interrupt Extension by dragging it to a closed System Folder. The extension will automatically be placed in the Extensions folder.

If you do not have this extension, you can download it from
<http://www.info.apple.com/swupdates/>

The software is located at the following path:

US

Macintosh
System
Other_System

8) Restart the server.

9) Proceed with the regular launching of the AppleShare File Server application.

IMPORTANT:

If you have any problems with any of the above steps, please call the AppleAssist Technical Support center for help. The number to call is in your Apple Service documentation included with your server.

System 7.5.5 & AppleShare 4.2.1 Compatibility (2/97)

Revised: 2/14/97
Security: Everyone

System 7.5.5 & AppleShare 4.2.1 Compatibility (2/97)

Article Created: 13 February 1997
Article Reviewed/Updated: 14 February 1997

TOPIC -----

This article is the System 7.5.5 and AppleShare 4.2.1 compatibility notice.

DISCUSSION -----

- For PowerPC Nubus- and PCI-based Apple Workgroup Servers, AppleShare 4.2.1, Mac OS 7.5.5, and Open Transport 1.1.1 have undergone extensive testing and together are fully compatible.
- For PowerPC Desktop Computers compatible with the retail version of AppleShare 4.2.1, AppleShare 4.2.1, Mac OS 7.5.5, and Open Transport 1.1.1 have undergone extensive testing and together are fully compatible.
- An extension named 7.5.5 SCSI Server Update has been created to resolve a bug that could cause a server to hang when a client computer performed a Find File operation on a server volume.
- This extension is only for use on PowerPC Apple Workgroup Servers and compatible PowerPC Desktop Computers running AppleShare 4.2.1 and Mac OS 7.5.5.
- The 7.5.5 SCSI Server Update has been rolled into Mac OS 7.6.
- For customers who need to run Mac OS 7.5.5 and AppleShare 4.2.1 on PowerPC Workgroup Servers, Apple requires that customers update their servers with the following software in this order:

- 1) Mac OS 7.5.5 Update,
- 2) Open Transport 1.1.1,
- 3) 7.5.5 SCSI Server Update, and
- 4) PowerPC Interrupt Extension

Where are these Updates located?

All of the following Updates can be found at the following URL:

Indian Language Kit: Includes New Key Caps Application (2/97)

Revised: 2/13/97
Security: Everyone

Indian Language Kit: Includes New Key Caps Application (2/97)

=====

Article Created: 13 February 1997

TOPIC -----

When I installed the Indian Language Kit it appears that a new version of the Key Caps desk accessory was installed in the Apple menu. Why?

DISCUSSION -----

The Indian Language Kit includes an updated version (beyond the version included with Mac OS 7.6) of the Key Caps desk accessory to provide better support of Indian languages. This new Key Caps is an application which can be launched from anywhere on your hard disk.

During installation of the Indian Language Kit, the installer automatically places Key Caps in the Apple Menu if an item already exists there with the name "Key Caps." On computers with a non-English version of Mac OS (which would not have an item called "Key Caps") the new Key Caps application is installed in the Apple Extras folder. You can drag it into the Apple Menu Items folder within the active System Folder if you want it to appear in the Apple Menu. You can also safely remove the localized version of the Key Caps desk accessory.

If you remove the Indian Language Kit, Key Caps will not be deleted. You can delete Key Caps manually by locating it in the Apple Menu Items folder inside the System Folder (or from wherever you placed it on your hard drive) and dragging it to the Trash. However, there is no need to do so because you can continue to use this version of Key Caps even without the Indian Language Kit installed.

Tips

- Improving 3D Performance
- Improving Video Capture
- Improving the Quality of Audio CD Recordings
- Allocating More Memory to Application Programs
- Using the Recent Documents Command in the Apple Menu
- Installing Acrobat Reader Software from the System Software CD
- Reinstalling or Removing Zip Drive Software
- Installing and Removing PCI Cards

Tips

=====

Improving 3D Performance

To increase 3D graphics performance on Power Macintosh models that include built-in hardware acceleration, follow these guidelines:

- * Make sure that the applications you are using support QuickDraw 3D.
- * Turn off virtual memory in the Memory control panel.
- * Hide the control strip in the Control Strip control panel.

- * Set the monitor Color Depth to Thousands and set the Resolution to 640x480, 67Hz in the Monitors & Sound control panel.

Improving Video Capture

To increase the speed and quality of video captures on Power Macintosh models that support video capture, follow these guidelines:

- * Turn off virtual memory in the Memory control panel.
- * In the Monitors & Sound control panel, set the color depth to Thousands.
- * Turn off AppleTalk. (You can quickly turn AppleTalk on or off with the Control Strip, or use the Chooser instead.)
- * Turn off the Menubar Clock in the Date & Time control panel.
- * Turn off all unnecessary extensions. Do not turn off QuickTime. (Use the Extensions Manager control panel to turn off extensions; then restart your computer.)
- * If you have installed Apple VideoPhone, remove the "QTCComponentDV" extension from the Extensions folder inside your System Folder, and then restart. (The "QTCComponentDV" video digitizer extension is optimized for video conferencing, but your Power Macintosh contains equivalent software that is optimized for video capture.)
- * Do not run programs other than the capture application while capturing video.
- * Reduce the size of the capture window. (picture quality is improved in smaller windows)
- * Make sure that your hard disk has enough free space to record. If you notice a decline in performance, use a disk optimizer to improve your disk's efficiency.
- * Make sure that the application program you use for capturing video has enough extra memory allocated for one second of video at the size and bit depth that you are using to record. For example, to record 30fps at 320x240 in thousands of colors requires at least 4500K (4.5 MB) free in the application partition. About This Macintosh (in the Apple menu) lets you estimate memory usage.
- * Do not allocate all of the available memory to the capture application. When your capture application is running, you should have an unused block size of at least 500K in About This Macintosh.

When working with applications that support adjusting video and sound settings, the following settings allow the highest video capture performance:

- * Use the Component Video video compressor. Do not use post-compression.
- * Set sound input sampling to 16 bits, stereo, and 44.1KHz for the highest quality. Do not use a sound compressor.

Improving the Quality of Audio CD Recordings

You can use the AppleCD Audio Player and SimpleSound (both available in the Apple menu) to record from an audio CD to a file on disk. If your recordings sound distorted when you play them, try lowering the volume level in the AppleCD

Audio Player and record the sound again.

Usually, you should get acceptable results when the volume is set to about the middle level. However, you may want to experiment with different volume settings; because audio CDs are recorded at various sound levels, individual CDs may require a different setting for optimal recording.

Allocating More Memory to Application Programs

If you are having new problems with application programs reporting that they do not have enough memory, System 7.5.5 may require programs to use an additional 23K of memory. To fix the problem:

1. Quit the program if it is open.
2. Click the program's icon to select it.
3. Open the File menu and choose Get Info.
4. In the Info window, increase the value in the "Preferred size" box by 23.
5. Close the window.

Using the Recent Documents Command in the Apple Menu

You can easily open any of your most recently used documents by choosing the Recent Documents command in the Apple menu, then choosing a document from the submenu. However, this feature can increase the time it takes to open some applications. This occurs because the recent-documents tracking includes all files that are opened--even those opened by an application as part of its launch sequence (such as drop-in filters used by desktop publishing packages). You can reduce the increased opening time by turning off the recent-documents tracking. You can either:

- * turn off "recent documents" tracking in the Apple Menu Options control panel
- * turn off Apple Menu Options in the Extensions Manager

Installing Acrobat Reader Software from the System Software CD

To install Acrobat Reader software from the system software CD onto your hard disk, make sure that the system software CD that came with your computer is not the startup disk. Then locate the Acrobat Reader folder on the CD and follow the installation instructions.

Note: To make sure that the system software CD is not the startup disk, shut down your computer. Then start up the computer while pressing the eject button on the CD-ROM drive (the disc is ejected). After the computer restarts, reinsert the CD and install the Acrobat Reader software.

Reinstalling or Removing Zip Drive Software

Some Power Macintosh models come with an internal Zip drive. Normally when you insert a Zip disk into this drive, an icon for the Zip disk appears on the Macintosh desktop. If an icon for the inserted disk does not appear on the desktop, the Iomega Driver in your System Folder may be missing or damaged. You can reinstall the Iomega Driver by following these steps:

1. Insert the system software CD-ROM disc that came with your computer.

2. Open the Iomega folder in CD Extras folder on the CD-ROM disc.
3. Drag the Iomega Driver icon to the System Folder icon on your hard disk.

One or more alert messages may appear. One will ask if you want to store the Iomega Driver in your Extensions folder, and another may ask if you want to replace a file that already exists.

4. Click the OK button in these alert messages.
5. Eject the CD-ROM disc. (Select the disc icon and choose Put Away from the File menu.)
6. Restart your computer.
7. Try inserting a Zip disc again.

Though only some Power Macintosh models include an internal Iomega Zip drive, your model includes Iomega software on your hard disk, even if your model does not come with a Zip drive.

If your Power Macintosh model does not include a Zip drive, you can remove this software if you wish. (Or you may also wish to keep this software in case you later purchase and connect a Zip drive.) Removing the software frees up disk space and makes your computer start up slightly faster. If you ever need to reinstall the Iomega software, it is available on the CD-ROM disc that comes with your computer.

To remove the Iomega software, drag the following icons to the Trash:

- * Iomega Driver (located in the Extensions folder inside your System Folder)
- * Iomega folder (located in the Apple Extras folder)

Installing and Removing PCI Cards

Your Power Macintosh User's Manual contains detailed instructions about installing peripheral component interconnect (PCI) expansion cards. Follow these instructions carefully when installing a PCI card. To avoid damaging the PCI slot when you install or remove a PCI card, do the following:

- * Do not rock the card from side to side; instead, press or pull the card straight into or out of the slot.
- * Do not physically insert or remove two cards at the same time; insert or remove each card individually.

For more information, see the file "Power Mac Read Me - Part 2."

Troubleshooting

=====

A Note on Troubleshooting Software

Many of the tips for troubleshooting software require you to know the version number of the application or system component you're working with. If you have more than one version of the item, the higher number is the more recent version. Before you begin troubleshooting, follow these steps to try determining the item's version number:

- * In the Finder, select the file in question.
- * Open the File menu and select the Get Info menu item.

The information displayed about the file frequently includes the item's version number.

For more troubleshooting information on the problems described below and other topics, refer to Macintosh Guide online help (available in the Guide menu when the Finder is active) and the manual that came with your computer.

Printing Problems

You have trouble printing with Apple PhotoFlash. Make sure that you have designated a printer in the Chooser. After doing so, open the File menu and choose the Print command.

You can't use the "Print Later" option with a non-networked printer. If you have the Assistant Toolbox extension installed on your computer and you want to use the "Print Later" option when printing on a non-networked printer, you must turn off the Assistant Toolbox extension and restart your computer.

To turn off the Assistant Toolbox extension:

1. Open the Apple (*) menu and choose Control Panels.

2. Open the Extensions Manager control panel.
3. In the list of extensions, click next to the Assistant Toolbox extension to remove the checkmark.
4. Restart your computer.

Problems with Sound

Problem: When you play back sound you've recorded, you notice clicks, pops, or skips.

Solution: This problem can occur if you have virtual memory turned on while you're recording sound. Turn off virtual memory before recording. For instructions on turning off virtual memory, refer to Macintosh Guide, available from the Guide menu when the Finder is active.

Problem: Your program requires the Sound control panel to set sound options.

Solution: Some application programs that use sound require the Sound control panel, an older control panel that has been replaced on your computer by the Monitors & Sound control panel.

The Sound control panel is located in the Apple Extras folder on your hard disk and in the CD Extras folder on the system software CD that came with your computer. To install it, drag it to the System Folder on your hard disk and then restart your computer.

Note: You can also install the Sound control panel by doing a custom installation of system software. For instructions, refer to the information on doing a custom installation in the Troubleshooting chapter of the manual that came with your computer. When the Custom Install dialog box appears, click "Sound control panel" in the list, then click Install.

Networking and File Sharing Problems

Problem: AppleShare displays incorrect information for large drives.

Solution: If you use File Sharing to share a disk larger than 2 gigabytes (GB), some older computers connected to your computer may display an incorrect size for the disk in the Get Info box. (Get Info reports the disk to be 2 GB in size, even if it is larger.) Because these older computers do not support the larger drives, they also cannot report correct information about the drives. (Computers with System 7.5 display correct information.)

Problem: You can't reconnect to a server.

Solution: If you unexpectedly lose a connection to a server on which you have items in use, and then choose the server from the Recent Servers item in the Apple menu, you get a message that the disk could not be opened because you do not have enough access privileges or because the server can't be found on the network. To reconnect to the server:

1. Close any open files. If any of your files contain changes that need to be saved, use the Save As command to save them on an available disk.
2. Choose the server from the Recent Servers item in the Apple menu.
3. If necessary, replace the files on the server with the ones you saved on an available disk when the server was not available.

Problem: You have problems using AppleShare Server Software version 4.1 or 4.2.
Solution: AppleShare server software versions 4.1 and 4.2 are not intended for use with PCI-based computers, including Power Macintosh 5500 and 6500 computers. If you attempt to use AppleShare server software version 4.1 or 4.2 with these models, you may experience problems.

Problems Using a RAM disk

Problem: You see a message that your RAM disk is unreadable.
Solution: Under some circumstances you may see the following message after setting up a RAM disk:

"This disk is unreadable by this Macintosh. Do you want to initialize the disk?"
(Important: This message applies to the RAM disk, not to your hard disk, which will not be initialized.)

Decrease the size of the RAM disk. If you see the message again, decrease the size again. Continue to decrease in small amounts until the message no longer appears.

Problems using a Zip Drive

Problem: You startup your Power Macintosh from a Zip cartridge (which contains a System Folder) and you get an error message instructing you to insert the Zip cartridge, even though it is already inserted.

Solution: This is a problem caused by an incompatibility between the Zip software and the Energy Saver control panel. You may work around this problem by creating an Energy Saver preferences file:

1. Click the Cancel button in the error dialog box.
2. Select Control Panels under the Apple Menu and select the Energy Saver control panel.
3. Choose your Energy Saver settings or if they are ok, select Quit from the File menu.

Your Zip cartridge will now startup without the error message.

Compatibility Problems with Added Software

=====

Adobe Premiere

Turn off virtual memory, make AppleTalk inactive, and restart your computer prior to installing Adobe Premiere Deluxe. Otherwise the mouse may freeze during installation. You turn off virtual memory in the Memory control panel. You make AppleTalk inactive in the Chooser or in the AppleTalk control panel. For instructions, refer to Macintosh Guide, available from the Guide menu when the Finder is active.

Aladdin DesktopTools

One feature of Desktop Shortcut, a component of the Aladdin Desktop Tools 1.0.2, is known to fail. If Shortcut is installed, when you are in an Open or Save dialog box, normally you can click in any window in the Finder. The

files/folders in that window will then appear in the Standard File Dialog box's scrolling list. To work around this problem, navigate using the Shortcut Menu icon. Aladdin Systems <<http://www.aladdinsys.com>> has been contacted about this problem and expects to release an update in the future to address the issue.

Apple PC Compatibility Card

If you purchase and install an Apple PC Compatibility Card, you must use PC Setup software version 1.5.4 or a more recent one. Older PC Setup software will not function properly in this Power Macintosh. To get an updated version of the software, first check for it on Apple's World Wide Web site: www.apple.com. Look under the item Product Information. If you do not find the software there, check with an Apple-authorized retailer and the Service and Support information that came with your computer.

Apple Video Phone

If the Self View window is completely covered by any window, the receiver on the other end of the Apple Video Phone connection will not get any picture. Make sure the Self View window is not covered by anything.

If you move the Self View window so it is partially off the bottom of the display, the window will turn black. Moving the Self View window so it is completely seen on the display will restore the window.

Apple Video Player

If you move the video window so it is partially off the bottom of the display, the video in the window may become distorted. Moving the video window back so it is completely on the display will restore the video.

Some TV or video sources may have "lines" appear at the top of the video window. These "lines" are a normal part of the video signal and are not due to any video problems. A TV set normally does not show the entire picture so these lines are hidden. Apple Video Player always displays the entire picture.

AppleShare and Connectix Speed Copy

There is an incompatibility between AppleShare Workstation software version 3.6.1 and Connectix Speed Copy (part of Speed Doubler version 1.1 or earlier). Use the Extensions Manager to turn off Speed Copy before you install this system software version, and contact Connectix to get the latest version of Speed Doubler. (You can contact Connectix at <http://www.connectix.com>, 415-571-5100, or 800-950-5880.)

Conflict Catcher

When using Conflict Catcher, a disabled extension may be moved to the top level of your hard disk. If this happens and you try to turn on the extension in the Extensions Manager control panel, you will not be able to turn it on, even though it appears in the list. To fix this problem, drag the desired extension into the "Extensions (Disabled)" folder (in the System Folder) before using the Extensions Manager.

Energy Saver control panel

The Energy Saver control panel is known to interrupt the play of audio CDs if "Shutdown instead of sleep" is selected. To avoid this problem, uncheck "Shutdown instead of sleep" in the Energy Saver control panel.

FWB Hard Disk ToolKit

If you are using a Power Macintosh model with an internal Zip drive and Hard Disk ToolKit is installed, you may see an alert message stating that the Iomega driver could not load because another driver is already controlling the drive. To prevent this message from appearing, do the following:

1. Open the Hard Disk ToolKit Extension Configuration application.
2. Turn off the "Check All SCSI Addresses" option.
3. Turn on individual checking for each SCSI ID except for SCSI ID number 5, which is the default SCSI ID for the Zip drive.
4. Restart your computer.

Japanese and Chinese Language Kits

To use the Japanese Language Kit with your computer, you must install version 1.2 or later. In the United States, you can obtain an upgrade by calling Claris at 1-800-293-6617.

To use the Chinese Language Kit with your computer, make sure you use version 1.1.1 or later. To install the Chinese Language Kit version 1.1.1, follow these three steps:

1. Install the WorldScript Updater 1.0.
2. Install the Chinese Language Kit version 1.0 or 1.1.
3. Install the Chinese Language Kit Updater to update your software to version 1.1.1.

IMPORTANT: Be sure to follow the steps in the order shown.

Microsoft Office

If you are using Microsoft Office 4.2.1, you may need the "Office 4.2x Update For Power Mac" version 1.0.1 extension, and the "Microsoft Office Manager Updater" version 4.2.1c. These files are available from the Microsoft World Wide Web site at <<http://www.microsoft.com>>. Download the MC1164.HQX and MOMUPDAT.HQX files.

Motorola Math Library and Connectix Speed Copy 1.3.1

There is a known incompatibility when these two products are used at the same time: the Motorola Math Library and Connectix Speed Copy 1.3.1 (part of Speed Doubler 1.3.1). If you have both of these items in the System Folder, Speed Copy 1.3.1 cannot be used. In order to use Speed Copy, remove the Motorola Math Library from the Extensions folder and restart your computer.

QuarkXPress

To use QuarkXPress on a PowerPC-based Macintosh computer, you must upgrade to QuarkXPress version 3.3.2 (or later).

Sagem GeoPort ISDN Adapter 1.0

There is a known incompatibility with the Sagem GeoPort ISDN Adapter 1.0, resulting in the inability to use the GeoPort ISDN Adapter. Sagem has been contacted about this problem and is working on a solution. For more information, visit the Sagem web site at <http://www.satusa.com>.

Important Information About Virtual Memory

=====

Virtual memory (VM) is a feature of the Macintosh that lets you use part of your hard disk as additional memory. If you are using an application program designed especially for Power Macintosh computers (often called a "native" application program), turning on virtual memory lets your application use less memory.

With virtual memory turned on, a Power Macintosh program uses less memory than when virtual memory is turned off. If you check the program's Get Info box before and after turning on virtual memory, you'll see that the numbers in the Memory Requirements box change. That is because turning on virtual memory allows the program to use memory more efficiently.

If you notice performance problems (such as your computer's responses seeming unusually slow) using certain application programs, you may want to turn off virtual memory.

For information on how to turn virtual memory on and off, choose Macintosh Guide from the Guide (question mark) menu, and click the Memory topic area. For best performance, try setting virtual memory to no more than 150% of the random-access memory (RAM) installed in your computer, or no more than 50% of your currently available hard drive space, whichever number is lower. For example, if your computer has 16 MB of RAM and your hard drive has 50 MB of available space, set virtual memory to a maximum of 24 MB (this is 150% of your 16 MB of RAM, and less than 50% of the available space on your hard drive).

To improve performance, you can also add memory (RAM) to your computer. See the user's manual that came with your computer for more information.

Important Information About Document Auto-Save

=====

The Energy Saver control panel contains a feature named "Document Auto-Save." The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Macintosh (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When an application is incompatible with Document Auto-Save, it will either not automatically quit, or it displays alerts or dialog boxes which

Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave no documents open that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel to sleep instead of shutting down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Macintosh Guide from the Guide (question mark) menu, and choose the Energy Saving topic area.

Other Document-Saving Products

There are conflicts when non-Apple document-saving control panels or extensions are used in conjunction with Energy Saver's Document Auto-Save. For best results, use the document-saving features of only one control panel or extension.

Self-Dismissing Dialogs

Under some rare conditions, the Energy Saver control panel may continuously dismiss dialog boxes if the Document Auto-Save feature unexpectedly fails during an idle or scheduled shutdown. (Whenever a dialog box appears, it is dismissed as if you have pressed the Return key.) To return things to normal, simply click the mouse button or press the space bar.

Important Information About Macintosh PC Exchange

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a MacOS-based computer, you must decompress the files and save them to a noncompressed DOS-format floppy disk.

Working With Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use PC Exchange to mount the MacOS-, DOS-, or ProDOS-format partitions as individual volumes on the Macintosh desktop. If the disk contains both MacOS- and DOS-format partitions, PC Exchange will recognize only the MacOS partition. In addition, PC Exchange will recognize ProDOS-format partitions only on SCSI hard disks that are less than 32 megabytes.

You can use PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge if they have the same format. However, you cannot use PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a MacOS-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple MacOS, DOS, or

ProDOS partitions, you need to use third-party software designed for partitioning hard disks and removable media cartridges.

Working with DOS-Format SCSI Removable Media Devices

In order for PC Exchange to recognize any SCSI removable media device, you must turn on the device and eject any cartridges before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. PC Exchange will install its own device driver for that SCSI device.

The Eject Disk command is unavailable when you are working with removable media devices. To unmount and eject a removable media cartridge, drag the device's icon to the Trash. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply reinsert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on a DOS or DOS-compatible computer, use the disk setup and partitioning software that came with the SCSI controller card installed in your PC or that came with your Bernoulli or SyQuest device. (Do not use the MS-DOS FDISK command.) Also, use the MS-DOS FORMAT command to format a newly initialized removable media cartridge on a DOS or DOS-compatible personal computer (PC) before you copy DOS files onto it.

When you initialize a removable media cartridge on a DOS or DOS-compatible PC, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media drive. If you do not, PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Working with DOS-Format SCSI Hard Disk Drives

In order for Macintosh PC Exchange to recognize a SCSI hard disk drive, you must turn on the drive before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. PC Exchange will install its own device driver for that SCSI device.

When initializing and formatting an external SCSI hard disk connected to a DOS or DOS-compatible PC, use the MS-DOS FDISK command or the disk setup and partitioning software that came with the SCSI controller card installed in your PC. In addition, you should use the MS-DOS FORMAT command to format and erase the disk before you copy DOS files to a new SCSI hard disk connected to a PC.

Tips and Problems

* A "Sad Mac" icon may appear on your screen at startup if a removable media cartridge has been left in the drive. To keep this problem from occurring,

manually eject removable media cartridges from their drives before you turn on your computer.

* Macintosh PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files that contain more than one gigabyte of disk space.

Indian Language Kit: Gujarati QWERTY Keyboard Change (2/97)

Revised: 2/14/97
Security: Everyone

Indian Language Kit: Gujarati QWERTY Keyboard Change (2/97)

=====

Article Created: 14 February 1997

TOPIC -----

I am trying to type a Viraam character using the Indian Language Kit. According to the Indian Language Kit User's Guide, the Viraam should be the default period (full-stop) on the Period key. However, it appears that the period (.) is the default. How can I type a Viraam?

DISCUSSION -----

The Gujarati QWERTY keyboard underwent a minor change after the Indian Language Kit User's Guide was printed so there is an error in the manual. Instead of the Viraam as the default period (full-stop) on the Period key, the period (.) is the default. Viraam can be typed by holding down the Option key and pressing the Period key.

Indian Language Kit: Which Scripts & Languages Supported? (2/97)

Revised: 2/14/97
Security: Everyone

Indian Language Kit: Which Scripts & Languages Supported? (2/97)

Article Created: 14 February 1997

TOPIC -----

What scripts and languages are supported by the Indian Language Kit?

DISCUSSION -----

The different languages on your computer are supported by software known as the script system. A script system makes a character set available for a particular language, tells your computer which characters to display when you type, specifies the direction of text flow, and provides other information such as sort order, date, time, number, and currency formats. If you are working in English on your computer, your system uses the Roman script.

If you are working in an Indian language, your system uses one of the Indian scripts provided by this kit. The script system generates the complex combinations of characters used in Indian languages in response to different sequences of keystrokes.

The Indian Language Kit supports several North Indian scripts. These scripts have letters representing consonants and vowel sounds. Many North Indian scripts depict words with a bar above all of the letters in the word. Also, when two consonants are joined together, a composite letter--a consonant conjunct--is formed. So, although there are a relatively small number of letters, there may be many more consonant conjuncts for a particular script.

The Indian Language Kit supports three North Indian scripts. Devanagari, Gurmukhi, and Gujarati. The same script can be used by several languages if they share most of the same characters and behaviors. For example, Devanagari is used for four languages: Hindi, Marathi, Nepali, and Sanskrit. Gurmukhi for the Punjabi language; and Gujarati for the Gujarati language. So, the Indian Language Kit supports three different scripts and six different Indic languages.

Indian Language Kit: Using Different Keyboard Layouts (2/97)

Revised: 2/14/97
Security: Everyone

Indian Language Kit: Using Different Keyboard Layouts (2/97)

=====

Article Created: 14 February 1997

TOPIC -----

I installed the complete version of the Indian Language Kit, but I am not sure which keyboard layout I should use. What is the differences among the several different layouts?

DISCUSSION -----

The Indian Language Kit offers two different layouts--Inscript and QWERTY--for each of the three Indian language scripts it presently supports (Devanagari, Gujarati, and Gurmukhi). An additional layout, Nepalese, is also provided for the Devanagari script only. Choose the layout according to the script and language you are using.

Inscript

=====

The default layout--Inscript--is available for all three scripts. Inscript uses the ISCII (Indian Script Code for Information Interchange) character set and is used for "normal" or phonetic typing. It is generally accepted as the standard Indian language keyboard layout as defined by an Indian standards organization in the Indian Government. It is optimized to be the fastest form of keyboard input for each script.

Using the Inscript layout, the computer combines these characters to form the large number of conjuncts used in Indian languages. This means that when you are typing in an Indian language, you do not have to search for the correct half-character sets to form a conjunct. When you type a certain sequence of consonants and vowels, the computer automatically generates the required character. Using the Inscript layout you can type the words according to how they sound, rather than how they finally appear on your screen. The computer automatically reorders vowels and consonants to produce the desired words in all three languages.

The default (Inscript) keyboard layouts for all three Indian language scripts

also support the Roman script when you hold down the Option key.

QWERTY

=====

The QWERTY keyboard layouts place Indian language characters on a QWERTY keyboard, in positions that correspond to Roman characters with similar pronunciation. They also provide a set of Roman numerals in the Option position. QWERTY is used primarily for Romanized typing.

Note that the QWERTY keyboard layout is used in the United States and displays the top-left keys on the keyboard in that order--Q W E R T Y. The Indian Language Kit currently does not provide a way to customize the layouts for AZERTY (French), QWERTZ (German and Swiss-French), QZERTY (Italian) or any other transliterated layout. Instead, use the Typing Tutor, included in the CD-ROM disc, to learn the Inscript keyboard.

Nepali

=====

The Nepali keyboard layout is used only with the Devanagari script and is compatible with the mechanical keyboard layout used in Nepal. The Nepali layout was added for Nepali users used to the traditional Nepali typewriters and is simply a rearrangement of the other Devanagari layouts.

Layout Installation

=====

If you install all the keyboards in the Indian Language Kit, they appear in this order in your Keyboards menu:

- Devanagari
- Devanagari QWERTY
- Nepali
- Gurmukhi
- Gurmukhi QWERTY
- Gujarati
- Gujarati QWERTY

Indian Language Kit: Fonts Appear Garbled (2/97)

Revised: 2/14/97
Security: Everyone

Indian Language Kit: Fonts Appear Garbled (2/97)

=====

Article Created: 14 February 1997

TOPIC -----

I recently installed the Indian Language Kit on my Power Macintosh 8100 computer, and I have realized that when I switch keyboard layouts the fonts appear garbled. What could be causing this?

DISCUSSION -----

This issue may occur on any NuBus-based Power Macintosh computers that are using system software older than Mac OS 7.6. This was noted in the Indian Language Kit Read Me file, and the solution is to switch to a keyboard layout of another language and then switch back to the desired keyboard layout.

Indian Language Kit: Don't Use Certain Fonts (2/97)

Revised: 2/14/97
Security: Everyone

Indian Language Kit: Don't Use Certain Fonts (2/97)

=====

Article Created: 14 February 1997

TOPIC -----

I have the Indian Language Kit installed on my computer, and I am confused by the number of fonts that are now appearing in the Font menu of my applications. Which fonts should I be using?

DISCUSSION -----

After installing the Indian Language Kit, your Font menus contain at least two fonts for each Indian Language. These fonts have different suffix--for example, Devanagari MTS and Devanagari MT. You should use the MT version of each Indian language font. (Do not use the MTS version; MTS fonts use Chicago as their associated Roman font and have no bold style).

Furthermore, if you have QuickDraw GX installed, you will see some additional fonts at the top of the Font menu that begin with a period (.) For example, you may see a font listed with the name ".Devanagari MT X" Do NOT use this or similar fonts. Instead, select the font "Devanagari MT."

For technical reasons, these fonts cannot be hidden, and in future versions of the Indian Language Kit, we hope these fonts will not be visible. In the meantime, follow these suggestions for choosing the proper font.

** The following list shows the fonts that you should NOT use. (You cannot remove these fonts from your Font menu.)

* On any computer with the Indian Language Kit installed, do NOT use these fonts:

Devanagari MTS
Gujarati MTS
Gurmukhi MTS

* Additionally, if you have QuickDraw GX installed, these additional fonts may

appear, which you should NOT use:

- .Devanagari MT X
- .Devanagari MT X (Bold)
- .Gujarati MT X
- .Gujarati MT X (Bold)
- .Gurmukhi MTX
- .Gurmukhi MTX (Bold)

** The fonts that you SHOULD use in conjunction with the Indian Language Kit:

- Devanagari MT
- Gujarati MT
- Gurmukhi MT

** Also, if you are using third-party fonts, you should note that the Indian Language Kit only supports non-Apple fonts which are both ISCII and WorldScript compliant.

Mac OS 7.6: Seeing Duplicate System Folders (2/97)

=====

Article Created: 14 February 1997

TOPIC -----

I recently performed a clean system installation of Mac OS 7.6. When I restarted the computer I saw a duplicate system folder. Clicking around in the window made the duplicate system folder disappear but after another restart, the duplicate was back. What is wrong?

DISCUSSION -----

Mac OS 7.6 and earlier versions of the Mac OS, like 7.5.x, are not the cause of this behavior. If you have installed Desktop Printing and have not selected a printer in the Chooser, double system folders may appear. This is a Desktop Printer issue.

To correct this, select a printer in the Chooser and a duplicate system folder should not reappear.

Power Macintosh: About Using Your CD-ROM Drive (2/97)

Revised: 2/14/97
Security: Everyone

Power Macintosh: About Using Your CD-ROM Drive (2/97)

=====

Article Created: 14 February 1997

TOPIC -----

This article contains the Read Me file, "About Using Your CD-ROM Drive", which is included with Power Macintosh 5500 and 6500 computers.

DISCUSSION -----

CD-ROM Sound and Vibration

=====

Your computer comes with a 12-speed (12x) CD-ROM drive, one of the fastest speeds available. The 12x CD-ROM drive reads CD-ROM discs very quickly, but because of the drive's high rotation speed, you may hear unanticipated sounds coming from it.

During CD start Up and long searches

For example, when you insert a CD disc into the CD-ROM drive, you may notice a few seconds of sound that makes you think either the disc is loose in the drive or something inside the computer has come into contact with the spinning disc. This sound may also occur occasionally when the drive scans the disc for data. If you hear it, do not be concerned. The sound is normal and the disc remains undamaged.

During regular CD-ROM operation

Today's high-speed CD-ROM drives normally cause a certain amount of sound and vibration. However, there are also some cases in which a CD-ROM disc label has artwork that causes the disc's weight to be slightly off-center. Occasionally, this uneven distribution of weight coupled with the high rotation speed of your CD-ROM drive can cause a disc to wobble in the drive and cause vibration. If your CD-ROM drive does begin to vibrate, you don't need to do anything special; continue to use the CD-ROM disc as you normally would. The vibration damages neither the CD-ROM disc nor the computer.

Tips

====

Installing Peripheral Component Interconnect (PCI) Cards

Some PCI cards must be installed in a particular slot in your computer. Consult the PCI card's user's manual, Read Me file, or the card manufacturer to determine if the card you are installing must be installed in a certain slot.

Troubleshooting

IMPORTANT The troubleshooting information in this Read Me file supplements the information provided in Macintosh Guide (available in the Guide menu when the Finder is active) and the manuals that came with your computer.

Printing Problems

You have trouble printing on a StyleWriter or StyleWriter II printer. Use the StyleWriter 1200 printer driver that came installed on your computer. Do not install your older StyleWriter driver; it is not compatible with PowerPC-based computers.

You can't use the Print Later option with a non-networked printer. If you have the Assistant Toolbox extension installed on your computer and you want to use the Print Later option when printing on a non-networked printer, you must turn off the Assistant Toolbox extension and restart your computer.

To turn off the Assistant Toolbox extension:

1. Open the Apple (*) menu and choose Control Panels.
2. Open the Extensions Manager control panel.

3. In the list of extensions, click next to the Assistant Toolbox extension to remove the checkmark.
4. Restart your computer.

You see a low-memory warning when you print Stickies on a StyleWriter, StyleWriter II, or StyleWriter 1200 printer. This problem can occur when the amount of memory Stickies uses is set below 150K. Increase the amount of memory available to Stickies. For instructions on changing the memory a program uses, refer to Macintosh Guide (available in the Guide menu when the Finder is active).

Performance Problems

You see a message that not enough memory is available. This problem can occur for several reasons. For detailed tips on memory-related problems, refer to both the troubleshooting information in the manuals that came with your computer and to the information on memory in Macintosh Guide (available in the Guide menu when the Finder is active).

If this problem occurs after you have opened the Extensions folder in the System Folder and scrolled through a long list of extensions, you can restore normal performance by restarting your computer.

Microsoft applications such as Microsoft Word, PowerPoint, or Microsoft Excel display messages that not enough memory is available and that you need to increase the size of memory available. Try quitting all applications before launching Microsoft applications. If this does not work, then try turning on virtual memory. The documentation that came with your computer and Macintosh Guide (available in the Guide menu when the Finder is active) contain more information about virtual memory.

Problems with Sound

HyperCard version 2.3.3 or earlier does not record sound properly on your computer. Other sound-recording application programs, including SimpleSound and the Sound control panel, can record sounds that you can import and play within HyperCard 2.3.

Some application programs that use sound require the Sound control panel, an older control panel that has been replaced on your computer by the Monitors & Sound control panel.

You can install the Sound control panel by doing a custom installation of system software. For instructions, refer to the information on doing a custom installation in the Troubleshooting chapter of the manual that came with your computer. When the custom dialog box appears, click "Sound control panel" in the list, then click Install.

Problems with Energy Saver

When using Energy Saver, if you schedule a startup time for your computer of 24 hours (or more) after the scheduled shutdown time, the computer may not start up at the scheduled time.

To solve this problem, after you change the scheduled shutdown or startup time, click the "Sleep Setup" button in the Energy Saver control panel.

Problems Using a RAM Disk

You notice performance problems when using a RAM disk. Make sure the RAM disk size is not set to 100% or you may experience performance problems.

Problems with Programs Freezing or Quitting Unexpectedly

Maple V quits unexpectedly when you change your monitor resolution. This can occur if you use the Control Strip to change the monitor resolution while the Maple V program is active. Use the Monitors & Sound control panel instead of the Control Strip to change screen resolution. For instructions on using the Monitors & Sound control panel, refer to Macintosh Guide (available in the Guide menu when the Finder is active).

When you try to install Adobe Premiere Deluxe, the mouse freezes. This can occur if you have virtual memory turned on and AppleTalk active when you try to install Adobe Premiere Deluxe. Turn off virtual memory and make AppleTalk inactive before installing. For instructions, refer to Macintosh Guide (available from the Guide menu when the Finder is active).

This problem does not occur if you select Adobe Premiere 4.2 installation instead of Adobe Premiere Deluxe.

Problems with Monitors

You have difficulty choosing a video resolution that works well. To select the best video resolution to use with your monitor and computer, use the Control Strip displayed in the bottom left corner of your screen. (If the Control Strip is not visible, display it by choosing Control Strip from the Control Panels submenu in the Apple menu.) The recommended resolutions are listed in a plain font. The resolutions listed in italics may not work with your hardware.

Compatibility Problems

=====

DOS Compatibility Cards

PCSetup is an application program that comes with DOS Compatibility Cards. PCSetup version 1.5 or earlier may not work with your computer.

If you have the DOS Compatibility Card sound cables installed, the output from the audio will be reversed.

CDPlusGraphics

Your computer displays error messages when you use the CDPlusGraphics application to play a CD-ROM disc that contains both sound and graphics. The graphics tracks of CD+G discs and MIDI tracks of CD+MIDI discs cannot be played

on the internal CD-ROM drive in your computer. (However, the audio tracks of these CDs can be played.) To play CD+G and CD+MIDI discs, use an external SCSI CD-ROM drive.

At Ease for Workgroups 3.0 and 3.0.1

If you are using a version of At Ease prior to 3.0.2, do not remove the At Ease ATA Extension from your Extensions folder. (This extension prevents the "Lock startup volume" checkbox from being available.) If you are using At Ease 3.0.2 or later or you are not using At Ease at all, you may remove the At Ease ATA Extension.

Ethernet Cards

The Ethernet CS II Card requires Open Transport software. To use Open Transport, open the Network Software Selector application in the Apple Extras folder and select Open Transport networking. Then use the AppleTalk and TCP/IP control panels to set up networking with the Ethernet CS II Card. (Do not use the Network and MacTCP control panels.)

MacIPX is not supported currently by Open Transport and therefore does not work with the Ethernet CS II Card or with any Ethernet PCI card.

The currently shipping versions of Apple IP Gateway and AppleTalk Internet Router are not compatible with Open Transport.

Shut down your computer before you connect or disconnect network cables from your computer.

If multiple network cards are installed, the AppleTalk Control Panel identifies the cards as A1, B1 or C1; slot A1 is the middle (PCI) slot, slot B1 is the top (PCI) slot, and slot C1 is the bottom (communication) slot.

External Modem Port

The installation of any internal modem in the communication slot will disable the external modem port. You can configure the printer port for an equivalent use after turning AppleTalk off.

Japanese and Chinese Language Kits

To use the Japanese Language Kit with your computer, you must install version 1.2 or later. In the United States, you can obtain an upgrade by calling Claris at 1-800-293-6617.

To use the Chinese Language Kit with your computer, make sure you use version 1.1.1 or later. To install the Chinese Language Kit version 1.1.1, follow these three steps:

1. Install the WorldScript Updater 1.0.
2. Install the Chinese Language Kit version 1.0 or 1.1.
3. Install the Chinese Language Kit Updater to update your software to version 1.1.1.

IMPORTANT: Be sure to follow the steps in the order shown.

STF PowerFax PE

If you use PowerTalk Direct Dialup Mail and have trouble sending a fax, it may be because both Direct Dialup and STF PowerFax PE are set to auto-answer. To turn off STF auto-answer, open the STF Setup window and set 'n' to "never" (in the "Answer on 'n' rings" section).

Emagic Logic Version 2.0.1

In order to use Emagic Logic version 2.0.1 and similar applications, the MIDI Manager extension may need to be installed.

PCI Video Cards

In order to use the Targa 2000 card, you must install it in slot A1 and turn virtual memory off. Refer to Macintosh Guide (available from the Guide menu when the Finder is active) for more information about turning virtual memory off.

In order to use the Media 100qx card, you must install it in slot A1 and turn virtual memory off. Refer to Macintosh Guide (available from the Guide menu when the Finder is active) for more information about turning virtual memory off. Also note that this card has special configuration requirements -consult the card's manufacturer to configure your system for best performance.

You may experience problems with other video capture cards on your computer. Please contact the card's manufacturer for instructions.

Important Information About Virtual Memory

=====

With virtual memory turned on, a Power Macintosh program uses less memory than when virtual memory is turned off. If you check the program's Get Info box before and after turning on virtual memory, you'll see that the numbers in the Memory Requirements box change. That is because turning on virtual memory allows the program to use memory more efficiently.

For information on how to turn virtual memory on and off, choose Macintosh Guide from the Guide menu when the Finder is active. Click the Memory topic area, and then click "How do I use hard disk space as memory?" and "Tips for PowerPC-based computers." Also, refer to the user's manual that came with your computer.

Important Information About Document Auto-Save

=====

The Document Auto-Save feature in the Energy Saver control panel automatically quits all open applications during an idle or scheduled shutdown, and saves changes to any open documents in each application. Since there are literally thousands of applications available for the Macintosh (with new ones always arriving), Apple cannot guarantee that Document Auto-Save will be compatible with every application. When Document Auto-Save is incompatible with an application, the application will not automatically quit and the computer will

not be shut down.

If you intend to turn Document Auto-Save on, monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave open no documents that are new or modified before a scheduled shutdown is to occur. You can modify the Document Auto-Save preferences in the Energy Saver control panel so the computer will sleep rather than shut down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Macintosh Guide from the Guide menu when the Finder is active and choose the Energy Saving topic area.

Other Document-Saving Products

There are conflicts when non-Apple document-saving control panels or extensions are used in conjunction with Energy Saver's Document Auto-Save. Examples of such products are NowSave and SuperBoomerang. For best results, use the document-saving features of only one control panel or extension.

Self-Dismissing Dialogs Boxes

Under some rare conditions, the Energy Saver control panel may continuously dismiss dialog boxes if the Document Auto-Save feature unexpectedly fails during an idle or scheduled shutdown. (Whenever a dialog box appears, it is dismissed as if you have pressed the Return key.) To return things to normal, simply click the mouse or press the Space bar.

Important Information About Macintosh PC Exchange

=====

AutoDoubler

Before you use AutoDoubler with Macintosh PC Exchange, you must open the AutoDoubler control panel and turn off the "Show DD on Compressed Files" option from the DD menu.

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using Stacker or other DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a Mac OS-based computer, you must decompress the files and save them on a noncompressed DOS-format floppy disk.

Working With Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use Macintosh PC Exchange to mount the Mac OS-, DOS-, or ProDOS-format partitions as individual volumes on the Macintosh desktop. If the disk contains both Mac OS- and DOS-format partitions, Macintosh PC Exchange will recognize only the Mac OS partition. In addition, Macintosh PC Exchange will recognize ProDOS-format partitions only on SCSI hard disks that

are less than 32 megabytes.

You can use Macintosh PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge if they have the same format. However, you cannot use Macintosh PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a Mac OS-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple Mac OS, DOS, or ProDOS partitions, you need to use third-party software designed for partitioning hard disks and removable media cartridges.

Working with DOS-Format SCSI Removable Media Devices

In order for Macintosh PC Exchange to recognize any SCSI removable media device, you must turn on the device and eject any cartridges before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the Macintosh PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. Macintosh PC Exchange will install its own device driver for that SCSI device.

The Eject Disk command is unavailable when you are working with removable media devices. To unmount and eject a removable media cartridge, click the device's icon to select it and choose Put Away from the File menu. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply reinsert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on a DOS or DOS-compatible computer, use either the disk setup and partitioning software that came with the SCSI controller card installed in your PC or the one that came with your Bernoulli or SyQuest device. (Do not use the MS-DOS FDISK command.) Also, use the MS-DOS FORMAT command to format a newly initialized removable media cartridge on a DOS or DOS-compatible personal computer (PC) before you copy DOS files onto it.

When you initialize a removable media cartridge on a DOS or DOS-compatible PC, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media drive. If you do not, Macintosh PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Working with DOS-Format SCSI Hard Disk Drives

In order for Macintosh PC Exchange to recognize a SCSI hard disk drive, you must turn on the drive before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the Macintosh PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. Macintosh PC Exchange will install its own device driver for that SCSI device.

When initializing and formatting an external SCSI hard disk connected to a DOS or DOS-compatible PC, use the MS-DOS FDISK command or the disk setup and partitioning software that came with the SCSI controller card installed in your PC. In addition, you should use the MS-DOS FORMAT command to format and erase the disk before you copy DOS files to a new SCSI hard disk connected to a PC.

Tips and Problems

* A "sad Macintosh" icon may appear on your screen at startup if a removable media cartridge has been left in the drive. To keep this problem from occurring, manually eject removable media cartridges from their drives before you turn on your computer.

* Macintosh PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files that contain more than one gigabyte of disk space.

Security: Everyone

Performa 6400/6360/GeoPort: How to Remove Modem Software (2/97)

Article Created: 15 February 1997
Article Reviewed/Updated: 19 February 1997

TOPIC -----

I have a Macintosh Performa 6360 or 6400 series computer that ships with a GeoPort Telecom Adapter

I want to remove the modem software from the System Folder. How do I do this?

DISCUSSION -----

NOTE: Not all Performa 6400 series computers ship with GeoPort internal modems. To determine what type of modem you have, search for Tech Info Library article "Macintosh Performa 6400: Which Modem is Included?". If you have a Global Village modem, search for Tech Info Library article "Performa 6400/GVC: How to Remove Modem Software".

IMPORTANT:

Do not use this article if you do not have a Performa 6360 or 6400 series computer.

Do not use this article for guidance on how to deal with Apple Telecom 2.x or earlier.

How to Remove Modem Software

There are three operational components to the "modem software": the modem software, the fax software, and a few support files for Megaphone.

If you are installing a new, external, voice capable modem, you should normally remove all three components in order to ensure there are no conflicts with your new modem.

This discussion is mainly concerned with software that modifies the operation of

the computer each time you start up. You will also need to remove the Megaphone folder from the Applications folder, and the Apple Telecom folder from the top (root) level of the hard disk -- be sure that Application Folder Protection is turned off in the General Controls control panel. If you throw away the latter folder, you will risk deleting any received faxes, as well as the only software which is capable of reading those faxes.

Also, there are a number of modem and communications utilities provided to support ClarisWorks, America Online (AOL), and the Apple Internet Connection Kit (AICK). These utilities are not modem specific, and should work with any type of modem.

Modem Software

Since the GeoPort Telecom Adapter is a software-based modem, there is basic modem software that lets the modem card serve as a modem. If you wish to remove this software, remove the following files:

Control Panels

- Express Modem

Extensions

- Apple Telecom Modem
- Express Modem Tool
- GeoPort for Power Macintosh
- GeoPort Serial Driver
- GeoPort Telecom Adapter
- GeoPort Telephone Tool
- GeoPort/Express Modem
- GeoPort/Express Modem CNG

Preferences

- Express Modem Preferences

Fax Software

The next major package is the fax software. The fax software is comprised of the following files:

Apple Menu Items

- Apple Telecom Status

Extensions

- AddressBookLib.ppc
- Apple Fax Gateway
- Fax Extension
- Fax Sender
- Fax Sender GX
- Log Extension
- Modem Scripts
 - GeoPort/Express Modem
 - GeoPort/Express Modem CNG
- Scripting Additions

Received fax folder

Mimetics

- EasyReader Fax
- Neuroneye
- UK Dictionary
- US Dictionary

Preferences

- Fax Extension Preferences

System suitcase (free in System Folder):

- Bell Telephone (sound resource)
- Electronic Telephone

CAUTION:

Do not throw away the System suitcase. Open the system suitcase and remove the sound files, if desired. If you move the System suitcase out of the System Folder, the computer will not start correctly the next time you start up.

Megaphone Software

The last major package is Megaphone. This support software is as follows:

At Ease Items

- At Ease Setups
 - Parents
 - MegaPhone
 - MegaPhone 2.0 Tour

Control Panels

- MegaDial

Extensions

- ANSI C++ PPC Lib
- CRC TelePort TelTool
- Cypress
 - MegaDial Files
 - MegaDial Locations
 - MegaDial Resources
- MegaPhone Menu
- MWRuntimeLib
- Telephone Manager Extension

Launcher Items

- MegaPhone II
 - Learning
 - MegaPhone 2.0 Tour

NOTE: Apple only supports the bundled version of Megaphone with the modem which was shipped with the computer. Even if you purchase an external voice-capable modem, this version of Megaphone may not work with it. If the external modem did

not come with its own telephony software, contact Cypress Research Corporation for compatibility and purchasing information.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Performa 6400/GVC: How to Remove Modem Software (2/97)

Article Created: 15 February 1997
Article Reviewed/Updated: 19 February 1997

TOPIC -----

I have a Macintosh Performa 6400 series computer that ships with a Global Village Platinum V modem. I want to remove the modem software from the System Folder, how do I do that?

DISCUSSION -----

NOTE: Not all Performa 6400 series computers have a Global Village modem. To determine the type of modem you have, search for Tech Info Library article "Macintosh Performa 6400: Which Modem is Included?". If you have a GeoPort modem, search for Tech Info Library article "Performa 6400/6360/ GeoPort: How to Remove Modem Software".

IMPORTANT:

Do not use this article for guidance on removing modem software from any other Performa computer bundled with Global Village software. The Performa 6400 includes no Global Village software, even if it comes with a Global Village modem, so the information below cannot be used for other systems. Search for Tech Info Library article "How to Remove Global Village Software" instead.

Do not use this article for guidance for dealing with Apple Telecom 2.x or earlier software.

How to Remove Modem Software

There are actually two operational components to the modem software: the fax software, and a few support files for Megaphone.

If you are installing a new, external, voice capable modem, you should normally remove all components of the bundled software in order to ensure there are no conflicts with your new modem.

This discussion is mainly concerned with software that modifies the operation of the computer each time you start up. You will also need to remove the Megaphone folder from the Applications folder, and the Apple Telecom folder from the top (root) level of the hard disk -- be sure that Application Folder Protection is turned off in the General Controls control panel. If you throw away the latter folder, you will risk deleting any received faxes, as well as the only software which is capable of reading those faxes.

Also, there are a number of modem and communications utilities provided to support ClarisWorks, America Online (AOL), and the Apple Internet Connection Kit (AICK). These utilities are not modem specific, and should work with any type of modem.

Fax Software

The first major package is the fax software. The fax software is comprised of the following files:

Apple Network Server: Viewing the AIX Boot Log (2/97)

=====

Article Created: 15 February 1997
Article Reviewed/Updated: 21 February 1997

TOPIC -----

How can I view the boot log on AIX 4.x?

DISCUSSION -----

The boot log on AIX 4.X can be view by typing the command:

```
alog -o -t boot
```

There may be more information than can fit in one screen, so you might want to try the command below and then press the space bar to the next screen:

```
alog -o -t boot | more
```

This information may prove useful if AIX stops during the boot process. You can boot AIX from the installation CD-ROM disc and enter the maintenance mode to view the boot log.

GeoPort & EM Updater: Change History (2/97)

=====

Article Created: 15 February 1997
Article Reviewed/Updated: 19 February 1997

TOPIC -----

This article is a brief description of the GeoPort and Express Modem Updater change history.

DISCUSSION -----

3.0 - Added V.34 functionality, up to 28.8 kbps, for GeoPort hardware running on a Power Macintosh computer and fixed minor bugs. Based on Apple Telecom 3.0.3 (ships in Japan only).

3.1 - Implemented up to 33.6 kbps connection speeds on GeoPort hardware running on a Power Macintosh computer, and fixing a memory fragmentation issue with the software. This update was never posted because it was superseded by 3.1.1

3.1.1 - Fixed the installer script. The installer was removing the old GeoPort Extension on a Macintosh Quadra AV computer, but not installing the new one.

This article was published in the 19 February 1997 "Information Alley."

Open Transport/PPP: Error Codes (2/97)

Article Created: 15 February 1997

TOPIC -----

This article provides a listing of the Open Transport/PPP (OT/PPP) error codes found in the Users Manual, pp. 62-63.

DISCUSSION -----

- 7102: OT/PPP did not load properly at system start up.
- 7103: OT/PPP could not set up a port.
- 7104: OT/PPP is out of memory.
- 7105: The requested action is not supported.
- 7106: One or more resources are missing from OT/PPP's installed files.
- 7107: The Remote Access Connections file is not compatible with the installed version of OT/PPP.
- 7108: An action requiring a connection was requested when there was no connection.
- 7109: The connection attempt or established connection was terminated by the user.
- 7110: The user name is unknown.
- 7111: The password is invalid.
- 7112: An unexpected error with no useful information has occurred.
- 7113: One or more of the installed OT/PPP files is damaged.

Revised: 2/17/97
Security: Everyone

AIX: Recovering From an Unknown root Password (2/97)

=====

Article Created: 17 February 1997

TOPIC -----

User entered root password with ergonomics keyboard in install_assist after installing operating system and password is not what user entered on the keyboard. So he does not know what the root password is.

DISCUSSION -----

Switch server key to the maintenance mode with the AIX installation CD and boot into maintenance mode or do a hard reset. Then access the rootvg from the CD and start a shell. You can modify the "/etc/security/passwd" file with vi by removing the encrypted password after the "=", leave the rest of the information in tack and save the file.

The root section of the passwd file should look similar to this:

```
root:
    password =
    lastupdate =
    flags =
```

Before you shutdown the server type:

```
sync; sync; sync
```

and press return.

To restart the server, press the reset button and move the key to the normal mode.

LC 580: CD-ROM Disc Not Mounting, Will Boot Off CD (2/97)

Revised: 2/18/97
Security: Everyone

LC 580: CD-ROM Disc Not Mounting, Will Boot Off CD (2/97)

=====

Article Created: 17 January 1997

TOPIC -----

The Macintosh LC 580 will boot off the backup CD-ROM but will not mount CD-ROM discs after restarting. If booting up with the backup CD-ROM, it mounts but will not eject and gives a -50 error.

DISCUSSION -----

The Macintosh LC 580 shipped with two different CD-ROM drives. Here is how this happened, the original LC 580 shipped with a double speed AppleCD 300i plus; later the LC 580 was revised and shipped with a quad spin AppleCD 600i. The faster CD-ROM drive requires a newer version of the AppleCD driver. The backup compact discs shipped with the revised LC 580 computer has this updated driver software.

Users may have many LC 580 computers, some with double speed drives and others with quad speed drives. If this happens the user will have two kinds of backup compact discs. Neither the computer, nor the backup CD-ROM disc indicate on their exteriors what version they are for. The user may have a backup CD-ROM disc and a computer that says LC 580 but the CD-ROM software on the backup disc may not work.

The AppleCD 300i drive's product code is CR-8004x. The AppleCD 600i drive's product code is CR-8005x.

If you have System 7.5.x or PC Exchange, you can use the PC Exchange control panel to determine which version of the CD-ROM drive you have in your computer. Follow the steps below:

Step 1

Open the PC Exchange control panel.

Step 2

Click Options in the lower right corner.

Step 3

If no compact disc is mounted, the drive make and CD-ROM product code will be listed under the Device Name section of the PC Exchange Options Window. As noted above, the AppleCD 300i drive will have a product code of CR-8004x. The AppleCD 600i drive will have a product code of CR-8005x.

A user will be able to boot a computer with a quad speed CD drive with a double speed backup compact disc to install system software, however, this compact discs will not mount once booted off the hard disk. The user needs to use the updated version of the drivers which are on the quad speed backup compact disc, which will install the newer CD-ROM Setup application. The newer version of the driver will NOT be installed if only the System 7.5 installer is run from this newer compact disc. The CD-ROM setup program must be installed as well.

The versions of the backup compact disc can be distinguished by their part numbers. The older, double speed versions of the compact disc are:

Version 1.0.1 part number 691-0462-B

Version 1.1 part number 691-3305-A

The newer, quad speed version of the compact disc is:

Version 1.1 part number 691-0793-A (has CD-ROM Setup v5.1.1)

If the customer cannot find the newer version, then the CD-ROM setup for the 600i can be fulfilled to them via SRF:

690-2961-A Disk CD-ROM Set from SRF 600i AAC-0010660

or sent via AAC Fulfillment:

D225 CD ROM Setup 5.1.1 (800K)

During the startup process, the computer checks all available SCSI volumes, including the CD-ROM drive. If the CD-ROM disc contains the ".AppleCD" driver, it will be loaded and used by the computer to access the CD-ROM drive in lieu of the CD-ROM software that would have loaded off the hard disk. If the CD-ROM disc has the drivers for a double speed drive it will load those drivers even if there is a quad speed drive. The boot process will force the drive to mount the CD-ROM disc even with the wrong version of the driver.

This causes the -50 error, which indicates that the internal parameters being used to eject the compact disc are incorrect. You should be able to eject the CD-ROM disc if you restart the computer again, and press the eject button on the CD-ROM drive before the computer displays "Welcome to Macintosh".

Using Apple Printer Drivers W/Third Party Applications (2/97)

Revised: 2/17/97
Security: Everyone

Using Apple Printer Drivers W/Third Party Applications (2/97)

=====

Article Created: 17 February 1997

TOPIC -----

Why do I have a different Print dialog box when using certain applications such as Adobe Pagemaker? There are print options that I would like to invoke but they don't appear in the dialog box. Is there a way to force my applications to use the Apple version of the printer driver?

DISCUSSION -----

As you have suggested, certain applications use custom printer drivers. These drivers use their own dialogs to set print options. To customize print jobs from applications that use custom printer drivers, consult the accompanying documentation.

For Adobe and many other third party applications, holding down the option key while selecting the Print menu item signals the application to use the Apple version of the printer driver rather than the application's custom printer driver.

Some fax software, such as that from Global Village, recognizes the option key being held down when selecting the Print menu item. In that case, the fax software is invoked rather than the Apple printer driver. Contact the software publisher for information on working around this issue.

PC Compatibility Card: Supporting Desktop Print Spooling (2/97)

Revised: 2/18/97
Security: Everyone

PC Compatibility Card: Supporting Desktop Print Spooling (2/97)

=====

Article Created: 17 February 1997

TOPIC -----

I have a PC Compatibility Card in my Macintosh. I am trying to print a Postscript file to my LaserWriter Select 310 while in the PC environment. The file is successfully spooled to the desktop printer folder on my Macintosh but then I get an error -7057 or an error -7805. What is wrong?

DISCUSSION -----

The -7075 error is "AppleTalk is not active". The error -7085 is "an unknown printer".

Desktop Printing software uses the LaserWriter 8.4 driver to perform the download of the print job to the printer. The LaserWriter 8.4 driver does not support serial printers. There are two solutions.

SOLUTION ONE

=====

You can disable Desktop Printing by disabling the following files:

Desktop Printer Extension
Desktop Printer Spooler
Desktop PrintMonitor

The Extensions Manager can be used to disable these files without removing them from your system, thereby allowing you to re-enable Desktop Printing in the future.

SOLUTION TWO

=====

Use Epson emulation when printing from the PC. The PC Compatibility Card User's Manual contains information on how to set PC Compatibility Card printer options.

Apple QuickTake 200: Extending Battery Life (2/97)

Revised: 2/18/97
Security: Everyone

Apple QuickTake 200: Extending Battery Life (2/97)

=====

Article Created: 18 February 1997

TOPIC -----

Is there any way to extend the life of the batteries in the Apple QuickTake 200 camera?

DISCUSSION -----

Here are several tips for extending the battery life.

- Use lithium batteries. These will give about twice the life of alkaline batteries.
- Use the clip on viewfinder and place the camera in the Battery-saving mode. The Battery-saving mode turns on the LCD screen for 5-8 seconds after you take a picture, allowing you to review the picture before the screen goes back to sleep.
- Use the Auto-Power-Off function. This turns the camera off after it is not used for two minutes.
- When you connect the QuickTake 200 camera to a computer, use the optional AC Adapter.

Apple QuickTake 200: Product Description (2/97)

=====

Article Created: 18 February 1997

TOPIC -----

This article contains the Apple QuickTake 200 product description.

DISCUSSION -----

Overview
=====

Given its many advanced capabilities, you'll probably be surprised to find that working with the Apple QuickTake 200 is strikingly similar to using your favorite traditional camera. But this sophisticated device offers many more ways of communicating with images.

In fact, this high-performance digital camera provides a wealth of flexible, versatile options for sharing your images with others, such as slide shows, presentations, television viewings, real-time videoconferencing, and even live Internet transmissions. And this advanced digital camera features an extremely compact, lightweight design that makes it easy to take with you virtually anywhere you want to go.

The QuickTake 200 provides an integrated LCD display that enables you to preview each potential picture easily and accurately. It also offers convenient removable storage capabilities and impressive image quality: It comes with a 2MB SmartMedia storage card that can accommodate as many as 20 high-quality images, 30 standard-quality images, or a combination—with clear 640- by 480- pixel resolution and in more than 16 million colors.

But the real fun of taking pictures lies in sharing them with others— an area in which the QuickTake 200 truly shines. Of course, you can always simply view your digital images on a computer screen or include them in documents. Or you can enhance your images on a computer, place the results back into the camera, and conveniently show them to friends and colleagues even when you're on the road. Apple's unique Camera Access software makes advanced capabilities such as these

not only possible, but simple.

Perhaps the most appealing quality of the QuickTake 200 is that it provides a complete solution for an entire range of digital imaging functionality. It even comes with a video cable—so, for example, you can use it to show relatives your latest vacation pictures right on their television screen. And the versatile image-capture capabilities of the QuickTake 200 make it an ideal tool to add images to your Internet web site.

In short, Apple's QuickTake 200 digital camera complements your Mac OS-based computer by offering a wide range of incredibly easy, and enjoyable ways to communicate your ideas visually.

Features

=====

Impressive image quality

- Provides clear 24-bit VGA images at resolutions of up to 640 by 480 pixels in more than 16 million colors
- Includes automatic white-balance feature to ensure the best possible image quality for both indoor and outdoor photography
- Takes advantage of Apple's ColorSync color-matching technology

Vivid, versatile LCD display

- Takes the guesswork out of selecting the precise images you want to capture by providing accurate, real-time preview
- Lets you review up to nine stored images simultaneously, so you can select the ones you want and delete the rest to save space
- Supports a slide-show mode that lets you cycle through images at timed intervals

Convenient, high-capacity storage

- Stores images on included 2MB removable storage card (SmartMedia); additional cards may be purchased separately
- Allows for simple, direct uploading of images from SmartMedia cards into any Mac OS-based computer equipped with PC Card slots, through an optional adapter
- Captures images in JPEG—and allows you to save them in TIFF, PICT, and EXIF formats—to share images with both Mac OS and Windows users

Flexible, simple image-capture options

- Lets you capture images in either of two modes: high quality and standard quality
- Features automatic exposure with a range of capabilities
- Offers three focal ranges—close-up, portrait, and landscape

Multiple image editing and sharing capabilities

- Comes with Apple's Camera Access software for fast, easy image uploading to a computer
- Includes bundled software that lets you easily and flexibly personalize captured images
- Makes it easy to enhance your e-mail memo, print document, computer-based presentation, or Internet web site with digital images captured on your QuickTake 200 using popular software

System Requirements

- A Macintosh computer with a 68040 or later processor, with 16MB of RAM and 24MB of available space on the hard disk drive; or a Power Macintosh computer with 16MB of RAM and 24MB of available space on the hard disk drive
- System software version 7.5 or later
- A CD-ROM drive
- A display that supports thousands or millions of colors is recommended for optimal viewing.

Ordering Information

Apple QuickTake 200 Digital Camera Order No. M5705LL/A

- QuickTake 200 digital camera for Mac OS users
- One QuickTake 2MB SmartMedia Card
- Clip-on optical viewfinder
- Video cable for connecting to standard NTSC television (where available) • Third-party bundled software (Adobe PhotoDeluxe 1.0, Adobe PageMill 2.0, PictureWorks NetCard 1.0)
- QuickTake software (includes Camera Access, QuickTime IC system extension and drivers)
- Serial cable for connecting camera to your Mac OS computer
- Four AA lithium batteries
- Hand strap
- QuickTake 200 User's Guide

Optional QuickTake AC Adapter Order No. M5707LL/A

-
- Lets you power your QuickTake 200 digital camera using AC power

Optional QuickTake 4MB SmartMedia Card Order No. M5708G/A

- Allows you to store as many as 40 high-quality images or 60 standard-quality images

Please check with your local reseller for the availability of other third-party QuickTake 200 accessories.

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Apple QuickTake 200: Technical Specifications (2/97)

Article Created: 18 February 1997

TOPIC -----

This article contains the Apple QuickTake 200 technical specifications.

DISCUSSION -----

Technical Specifications
=====

Image Resolution

- 640 by 480 pixels (all images); high-quality and standard-quality modes

Color Resolution

- 24-bit color

Storage

- Space for 20 high-quality images, 30 standard-quality images, or a combination on included 2MB SmartMedia Card (additional cards may be purchased separately)

Electronic Shutter Speeds

- 1/4 to 1/5000 second

Aperture Settings

- f2.2 to f8.0; user-selectable

Focus Capabilities

- Fixed focus

Focus Range

- Focus-free lens (38mm equivalent) with three focal ranges:
 - Close-up: 3.5 to 5 inches (9 cm to 13 cm)
 - Portrait: 17 to 35 inches (45 cm to 90 cm)
 - Standard: ~3 feet to infinity (0.9 m to infinity)

LCD Viewing Panel

- 1.8-inch panel on back side; provides live preview-ing at 30 frames per second; frame-by-frame play-back mode (3-, 5-, or 10-second intervals; review of up to nine images)

Power

- Runs on four AA lithium batteries
- Power-saving mode turns off the LCD to extend battery life
- Includes connector for optional AC adapter

Connectivity

- Built-in serial interface with appropriate cable for connection to Mac OS-based computers
- NTSC video output and video cable

Image Viewing/sharing Options

- Direct connection to any Mac OS-based computer
- Video connection to any standard television (NTSC) or VCR
- 9-up image display
- Auto-presentation mode

File Formats

- PICT, JPEG, TIFF, EXIF

Other Features

- 10 second self-timer
- Tripod mount

Software

- QuickTake Camera Access software
- PhotoShop Acquire Compatible Plug-in

Third-party Bundled Software

- Adobe PhotoDeluxe 1.0, to enhance images
- Adobe PageMill 2.0, to create web pages with images
- PictureWorks NetCard 1.0, to create Internet "picture postcards"

Size and Weight

=====

- Height: 3.0 in. (7.6 cm)
- Width: 5.1 in. (13.0 cm)
- Depth: 1.9 in. (4.8 cm)
- Weight: 8.5 oz. (241 g)

System Requirements

=====

- A Macintosh computer with a 68040 or later processor, with 16MB of RAM and 24MB of available space on the hard disk drive; or a Power Macintosh computer with 16MB of RAM and 24MB of available space on the hard disk drive
- System software version 7.5 or later
- A CD-ROM drive
- A display that supports thousands or millions of colors is recommended for optimal viewing.

Apple Media Tool 2.0: Creating an Automated Slide Show (2/97)

Revised: 2/18/97
Security: Everyone

Apple Media Tool 2.0: Creating an Automated Slide Show (2/97)

=====

Article Created: 18 February 1997

TOPIC -----

I am trying to create a project in AMT 2.0 that acts like an automated slide show. I want it to go from one screen to next every 30 seconds with no user interaction. How can I do this?

DISCUSSION -----

In Apple Media Tool 2.0 you can achieve this by creating on each screen an object with a certain duration. For example, you might use your bg pict file and give it a duration of 30 seconds.

On screen 1, set an "after display" event, with command to "start" the object with the duration.

Set a "finished" event for that object, with a link command to bring you to the next screen.

Each screen should have an object with a duration, some event to start the object, and another "Finished" event that will link to the new screen.

In Apple Media Tool 2.1, a new feature called Timer Object with an On Time event can be used for the same purpose. See the Apple Media Tool 2.1 addendum for instructions on using this new feature.

Network Assistant & Copying Invisible Files (2/97)

Revised: 2/18/97
Security: Everyone

Network Assistant & Copying Invisible Files (2/97)

=====

Article Created: 18 February 1997

TOPIC -----

This article describes which invisible files Network Assistant can be copied from a hard disk.

DISCUSSION -----

Network Assistant, part of the Apple Network Administrator Toolkit (ANAT), will not copy invisible files at the root (first) level of the hard disk. This includes the desktop folder, trash, temporary items folder, and others.

Network Assistant can copy invisible files that are not at the root level of the hard disk.

DISCUSSION -----

Technical Specifications
=====

Newton Intelligence
Newton Recognition Architecture

- * Recognizes handwriting-printed, cursive, or a mixture of the two-with the assistance of a 93,000-word, built-in word list
- * Lets you add words to the built-in word list
- * Includes four pop-up keyboards: typewriter, numeric, phone, and time/date
- * Recognizes graphics and symmetrical objects

Newton Communications Architecture

- * Provides built-in support for serial communications, external keyboard, PC Card modems, sending and receiving faxes, and e-mail
- * Provides a single interface for modular, object-oriented communications services
- * Supports new communications capabilities through its modular design
- * Supports Group 3 and Class II fax machines

Intelligent Assistance Architecture

- * Helps users complete repetitive tasks including communications, scheduling, finding, and reminding
- * Contains smart defaults that anticipate your needs, saving you time in entering data
- * Integrates data from different built-in applications
- * Supports third-party extensions

Newton Hardware Architecture

- * StrongARM 110 RISC processor at 161.9 MHz
- * Apple custom system chip set
- * 5MB RAM (1MB of DRAM, 4MB of Flash RAM)
- * 8MB of mask ROM
- * Low-power, transfective 4.9 in. by 3.3 in. (129.8 mm by 83.2 mm) LCD display with EL backlight (480 by 320 pixels at 100 dpi, with 16-level grayscale)
- * Nonglare resistive tablet and pen
- * Two Type II PC Card slots
- * Newton InterConnect external port supporting:
 - Serial RS-422-compatible serial connections or LocalTalk
 - Serial modem interface
 - Power in and out
 - Audio in and out (line level)
 - Autodock support
- * One internal serial slot supporting:
 - Serial RS-422-compatible serial connections or LocalTalk
 - Serial modem interface
 - Serial keyboard (option)
 - Power in and out
 - Audio in and out (line level)
- * Dual-mode infrared transceiver for wireless data transfer at up to 115 Kbits/s (IrDA mode) and 38.4 Kbits/s (ASK mode) within 3.28 ft. (1 m)
- * Keyboard (included with some configurations)
- * Built-in speaker
- * Built-in microphone
- * Fast charge for optional Newton Rechargeable Battery Pack that charges in 1 hour when not operating
- * Optional external Newton 9W Power Adapter for unit operation or fast charging of Newton Rechargeable Battery Pack
- * Protective removable screen lid
- * Integral pen storage

Communications capabilities

- * Communicates via e-mail or taps into online services and the Internet or an

intranet with an optional wired or wireless modem card and included software

- * Faxes using optional fax modem (automatic cover-page generation, post-formatting)
- * Supports a variety of serial, parallel, IrDA, and network printers
- * Receives and stores wireless messages and pages using optional messaging cards
- * Beams notes, name cards, appointments, and packages using high-speed infrared technology
- * Automatically dials phone calls with assistance from intelligent auto-dialing (DTMF or modem dialing)*
- * Connects to cellular or GSM phones for wireless data and fax communications with optional PC Modem Card

Size and weight

=====

- * Height: 1.1 in. (27.5 mm)
- * Width: 4.7 in. (118.7 mm)
- * Depth: 8.3 in. (210.3 mm)
- * Weight: 1.4 lb. (0.64 kg) with alkaline batteries

Operating environment

=====

- * Temperature: 32° to 104° F (0° to 40° C)
- * Storage temperature: -4° to 117° F (-20° to 60° C)
- * Transit temperature: -4° to 149° F (-20° to 70° C) for up to 72 hours
- * Relative humidity: 5% to 95% noncondensing

Power requirements

=====

- * Power adapter
 - Universal, 100 to 240 V AC, 50/60 Hz
 - Four adapter plug configurations:
 - U.S., U.K., Europe, and Australia
- * Newton 9W Power Adapter (optional) uses 9W batteries
- * Battery type: AA (LR6) alkaline or NiMH battery pack
- * Built-in fast charger for optional NiMH battery pack
- * Power sources: four AA alkaline batteries (included), optional Power Adapter, or optional NiMH Rechargeable battery pack

Computer connectivity requirements

=====

- * Works with PC-compatible computers with 80386DX or later processors (80486 recommended) running Windows 3.1 or later

* Works with Mac OS-based computers with 68030 or later processors and system software version 7.1 or later

Printer support

=====

* Offers built-in printer support for Apple LaserWriter Plus (and other PostScript-equipped LaserWriter printers), Personal LaserWriter LS, and Personal LaserWriter 300, as well as StyleWriter printers and Hewlett-Packard DeskWriter printers

* Works with the Hewlett-Packard LaserJet 5MP and DeskJet 340 through IrDA

* Works with most popular PC printers including the Hewlett-Packard LaserJet II and DeskJet 500; Canon BubbleJet 10e; and Epson LQ, Action, and FX printers using the optional Newton Print Pack

Fax machine support

=====

* Supports Group 3 and Class II fax machines

Accessories

=====

* The MessagePad 2000 with Newton 2.1 operating system is compatible with most accessories available for the MessagePad 130 with Newton 2.0 operating system. Please see the MessagePad Accessories data sheet for detailed information.

Apple eMate 300: Product Description (2/97)

Revised: 2/18/97
Security: Everyone

Apple eMate 300: Product Description (2/97)

=====

Article Created: 18 February 1997

TOPIC -----

This article contains the product description for the Apple eMate 300.

DISCUSSION -----

General Information

=====

Designed for Education By Educators

The Apple eMate 300 is the first of a new class of affordable mobile computer that works as a companion to Mac OS- and Windows software-based computers in a Distributed Learning Environment (see back page). Developed in collaboration with educators to meet the specific needs of education, the eMate 300's unique industrial design is rugged enough to withstand the rigors of being carried, shared, and used in a variety of environments. The eMate 300 is easily portable for even the youngest students-it weighs only 4 pounds and is small enough to fit in a backpack. And it lets users enter data by keyboard, or with a stylus, so students can work the way that's best for them.

The eMate 300 features the powerful and easy-to-use Newton operating system. It comes with built-in software applications that are important for learning-including word processing, drawing, spreadsheet, a graphing calculator, address book, calendar functions, and more. In addition, the eMate 300 can take advantage of hundreds of applications that have been developed for Newton 2.0, as well as applications designed specifically for education.

Gives More Students Access to the Technology They Need

While there are more computers in the classroom today than ever before, there are still not enough to go around. At an affordable price and with personalized workspace for multiple students, the eMate 300 makes technology accessible to a greater number of students than is possible with desktop computers.

Allows Students to Learn Wherever Learning Takes Them

The versatile functionality of the eMate 300 lets students do the majority of their critical learning wherever it's most appropriate-in the classroom, in libraries, in a lab, outdoors, or at home. With its incredibly long battery life and backlit screen that displays the width of a full written page, the eMate 300 makes it possible for students to work wherever they want, for as long as they want.

Easy Communication and Networking

Robust communications capabilities make the eMate 300 an especially useful tool in a Distributed Learning Environment. Students can share data and files they create on the eMate 300, with both Mac OS-and Windows software-based computers.* By doing preliminary work on the eMate 300 and then enhancing it on a desktop computer, students can use the eMate 300 as a perfect companion to the computers that already exist in the classroom or at home. The serial port, Newton InterConnect Port, and PC Card slot makes it easy to print, share, and backup any work done on the eMate 300. TCP/IP capabilities-the protocol of the Internet-give students access to materials on the World Wide Web, and lets them send and receive e-mail so they can conduct research and keep on top of lessons. And with built-in infrared technology, the eMate 300 lets educators and students "beam" their work to one another for quick, easy file sharing.

* note: cables not included.

What is a Distributed Learning Environment?

A Distributed Learning Environment provides learning for anyone, anytime, anywhere. It extends the reach of learning from the classroom to the library, lab, home, local communities, and the world. In the best Distributed Learning Environments, educators and students are able to take full advantage of a range of technology to make the extended learning environment more meaningful, effective, and engaging.

Four Elements for Successful Learning

Apple's support of the Distributed Learning Environment concept is based on its commitment to four critical elements of successful learning experiences:

- Information access.
Students and teachers need convenient access to information no matter where it resides.
- Communication and collaboration.
Students and teachers need to be able to communicate and collaborate with other students, colleagues, and experts, anytime, anywhere.
- Multisensory experiences.
Students and teachers need multimedia tools for understanding and expression, in addition to traditional educational methods, to help them communicate ideas in the way that is most appropriate to the task and compatible with diverse learning styles.

- Convenient, mobile tools.

Students and teachers need personal learning materials (pencils, books, calculators, etc.) that are convenient, creative, and mobile support tools.

Building on schools' investments

As learning extends from the classroom to the home, local community, and the world, students and educators require a range of technology tools. Many schools already have some of the core technology components of a Distributed Learning Environment.

- Desktop computers-either Mac OS- or Windows software-based. This includes multimedia computers that are dedicated to letting students experience powerful, creative, multi-sensory learning by integrating text, video, sound, and graphics in their work.
- Peripheral products-such as printers, scanners, and digital cameras.
- Networks-which could range from a simple connection to a printer, to a local network of personal computers, to a connection to a server.
- Affordable, mobile computer technologies-that function as a personal companion to existing desktop technologies in the classroom, school, and home.

Until now, few schools have had all of the core components of a Distributed Learning Environ-ment because low-cost, mobile technologies were not available. Now, the missing technology link in supporting the learning process is found in the Apple eMate 300-the first in a new class of truly affordable, mobile computers that act as companions and extensions to schools' existing desktop computers.

Giving more students access to the technology they need

The Apple eMate 300 fulfills the vision of a Distributed Learning Environment. It is an affordable mobile computer that lets teachers create a learning environment in which students have the appropriate tools to gather data, access the information they need, express their thoughts, communicate with one another, and collaborate on solving problems. Designed in collaboration with leading educators all across the country, the eMate 300 is the perfect companion to existing technology in the classroom, school, or home, with capabilities that make it an excellent tool of discovery and productivity. It is lightweight and rugged, and comes with built-in applica-tions and communications capabilities that let students work anyplace, anytime. What's more, it's available at a price that makes it possible to provide more students than ever access to the technology they need to get their work done and acquire skills that prepare them for lifelong success.

Key Features:

The Apple eMate 300

=====

Built-in applications:

- Word processor, drawing program, spreadsheet, graphing calculator, address book, calendar functions and more

Power and speed:

- 25-MHz ARM 710a RISC processor
- High-speed infrared (IrDA) port for transferring data wirelessly at up to 115 kilobits per second within 3.3 feet (1 meter)

Memory and storage:

- 3MB of RAM (1MB of DRAM and 2MB of flash memory); 8MB of ROM

Display:

- 480- by 320-pixel gray-scale LCD with back-lighting; displays up to 16 shades of gray

Sound:

- Built-in speaker and sound input/output ports

Expansion:

- PC Card slot for Type I, Type II, or Type III PC Cards (PCMCIA)
- Slots for upgrading software, operating system, and memory
- Serial port for connecting to printers and AppleTalk networks
- Newton InterConnect serial port for LocalTalk and RS-232-compatible serial connections, modem, power input/output, sound input/output, and automatic docking to personal computers*

* note: cables not included.

Size, weight and battery:

- Dimensions: 12.0 by 11.4 by 2.1 inches (305 by 290 by 53 millimeters)
- Weight: 4 pounds (1.8 kilograms)
- Battery: Up to 28 hours of continuous use without recharging, depending on usage

Printer support:

- Works with the following Apple printers: Personal LaserWriter LS, Personal LaserWriter 300, and StyleWriter printers; PostScript-equipped LaserWriter printers
- Works with most popular PC printers using the optional Newton Print Pack.

Information about Apple Education products and services can also be found on the Internet at <http://education.apple.com/>

Apple MessagePad 2000: Product Description (2/97)

=====

Article Created: 18 February 1997

TOPIC -----

This article contains the Apple MessagePad 2000 product description.

DISCUSSION -----

MessagePad 2000 with Newton 2.1 Operating System

Description

=====

Now, with the Apple MessagePad 2000 handheld computer, you don't have to lug a heavy laptop around anymore. That's because this small wonder weighs under a pound and a half, yet puts all the business applications you need—word processor, spreadsheet, datebook, contacts, and to-do lists—at your fingertips.

Slip a modem into one of its two PC Card slots, and you can send and receive e-mail and faxes, and connect to the Internet or an intranet. You can even pair the MessagePad 2000 with your cellular phone or wireless modem, and connect from virtually anywhere.

In terms of speed, the new StrongARM processor in the MessagePad 2000 allows it to run up to 10 times faster than any previous model. It also includes more memory. The backlit screen—larger than that of any other MessagePad—displays sharp graphics in 16 levels of gray at 100 dots per inch. And the internal microphone and speaker allow you to record and playback voice notes.

The MessagePad 2000 includes all the cables and software you need to connect to your Mac OS- or Windows software-based computer. It lets you import and export data for use with most popular personal computer software programs, and make backups.

But probably the best news for busy professionals on the move is that the MessagePad 2000 can deliver over 24 hours of continuous battery life. So no

matter where or how you're traveling, the MessagePad 2000 is the smart choice for staying connected, and for putting critical information at your fingertips when you need it.

Features

=====

Built-in organization functions

- * Includes business software programs: word processor, e-mail, World Wide Web browser, and spreadsheet
- * Allows freeform notes, outlines, lists, and phone logs
- * Helps you plan activities using the calendar, and manage priorities using the To Do List
- * Includes customizable name and address files
- * Offers productivity tools such as time-zone maps, a calculator, and currency exchange

Built-in communications

- * Includes Internet access through TCP/IP, PPP, SLIP, PAP, and CHAP protocols, and a World Wide Web browser
- * Imports and exports data, installs software, and backs up files with your personal computer using the included Newton Connection Utilities
- * Can send and receive faxes and electronic mail using an optional wired or wireless modem
- * Prints formatted letters and notes using Apple printers, IrDA printers, and serial or parallel printers with the optional Print Pack
- * Lets you beam notes, messages, packages, schedules, and business cards via built-in infrared communications
- * Assists you in making phone calls, finding information, and sending and receiving e-mail and faxes

Expandable Functions

=====

- * Contains two slots for PC Card peripherals such as modems, pagers, wireless communicators, and storage cards
- * Includes a serial port for connecting to personal computers, printers, the Newton Keyboard, or external modems

* Supports a variety of third-party productivity, finance, time and billing, and information management software

Accessories

=====

* The MessagePad 2000 with Newton 2.1 operating system is compatible with most accessories available for the MessagePad 130 with Newton 2.0 operating system. Please see the MessagePad Accessories data sheet for detailed information.

AIX 4.x: Sending Mail to Hosts You Cannot Ping (2/97)

Revised: 2/19/97
Security: Everyone

AIX 4.x: Sending Mail to Hosts You Cannot Ping (2/97)

=====

Article Created: 19 February 1997

TOPIC -----

With my Apple Network Server running AIX 4.x, I am unable to send mail to hosts that I cannot ping. Is there a way to do this?

DISCUSSION -----

With AIX 4.x, by default you are not able to send mail to hosts you cannot ping on the Internet. To enable sendmail, to forward mail to hosts that cannot be pinged, you will need to uncomment the "OK MX" statement in your "/etc/sendmail.cf" file. In other words, remove the # symbol before the "OK MX" statement. Below is an example showing what that section of the sendmail.cf file should look like.

```
# You may use any combination of these, although it is recommended that
# you specify MB if MR is specified. For example, "OK MG MX" would enable
# the use of Mail Group and Mail Exchanger resource records.
#
# The default is not to use a name server for resolving recipients.
#
OK MX
```

```
# Name of the codeset for Japanese network.
# Sendmail will convert mail from/to the codeset of a locale to/from
# the codeset of the network specified with this option.
# Note: The OObcodeset option must also be set when using the Obcodeset
# option.
# Obcodeset
```

This is the only modification you need to make. For this change to take effect, you need to rebuild the sendmail configuration database and refresh the sendmail subsystem. The commands below are an example of how to do this:

```
/usr/sbin/sendmail -bz  
refresh -s sendmail
```

Open Transport Client & DHCP Update (3/97)

Revised: 3/10/97
Security: Everyone

Open Transport Client & DHCP Update (3/97)

Article Created: 19 February 1997

TOPIC -----

How can we force Open Transport clients to re-acquire their DHCP (Dynamic Host Configuration Protocol) configuration? We want to be assured that when a change is made on the DHCP server that the change is propagated to the client in a timely fashion. Windows 95 includes the ability to cancel and re-acquire DHCP leases in its WINIPCFG utility and we would like something similar for Macintosh computers.

DISCUSSION -----

Open Transport clients release their DHCP address lease whenever the TCP/IP stack becomes inactive. This can be accomplished by:

- Restarting the Macintosh
- Select "Make TCP/IP Inactive" in TCP/IP Options of the TCP/IP control panel. You must save the changes after closing the TCP/IP control panel and wait two minutes for the timers to release the current TCP/IP sessions. Then select "Make TCP/IP Active" in the TCP/IP Options of the TCP/IP control panel. Once again save the changes after closing the TCP/IP control panel.

NOTE: User Mode in the TCP/IP control panel must be Advanced or Administrative. TCP/IP Options button is not available in Basic mode.

When the TCP/IP stack becomes active again, it contacts the DHCP server for configuration information and will acquire any changes made at the server.

This article was published in the 19 February 1997 "Information Alley."

AIX: Backspace Does Not Work in Command Shell Utility (2/97)

Revised: 2/19/97
Security: Everyone

AIX: Backspace Does Not Work in Command Shell Utility (2/97)

=====

Article Created: 19 February 1997

TOPIC -----

The command shell utility supplied with the AIX on the Apple Network Server does not let the user use the back space key.

DISCUSSION -----

The easiest solution is after the user has a command shell login, type:

```
set -o emacs
```

This will correct backspace key mapping.

Desktop Patterns: Pattern Settings Stored In System File (2/97)

Revised: 2/20/97
Security: Everyone

Desktop Patterns: Pattern Settings Stored In System File (2/97)

=====

Article Created: 20 February 1997

TOPIC -----

Where are the desktop and utility pattern settings configured by the Desktop Patterns application stored? I've tried copying the Desktop Pattern Prefs file from the Preferences folder from one computer in my lab to another, but on startup none of them assume the desktop pattern of the original computer.

DISCUSSION -----

The collection of patterns from which you may choose is stored in the Desktop Pattern Prefs file. You can transport one collection of patterns between computers by moving this file alone.

The desktop and utility pattern choices you make with the Desktop Pattern application are written directly to the 'ppat' resource of the System suitcase. These pattern choices can be altered with the Desktop Patterns application; an AppleScript, QuicKeys, or Frontier script designed to perform the same function; or by using a resource editor like ResEdit and modifying the 'ppat' system resource.

The Desktop Patterns application is a component of System 7.5 and later and is located in the Control Panels folder.

WARNING:

This article refers to using ResEdit to alter your system software. Apple Computer, Inc., is not liable for any damage done to your software through the use of ResEdit to alter the software. The Apple Assistance Center phone representatives (at 800-SOS-APPL) do not provide technical support for ResEdit. It is supported by APDA. For contact information on APDA, search the Tech Info Library under "APDA".

PowerBook 3400 Series: Questions & Answers (2/97)

Revised: 2/24/97
Security: Everyone

PowerBook 3400 Series: Questions & Answers (2/97)

=====

Article Created: 20 February 1997

TOPIC -----

This article contains the following frequently asked questions (FAQ) about the PowerBook 3400 series computers and answers to those questions.

- 1) Can the PowerBook 3400 Series CD install Mac OS 7.6 onto my desktop Power Macintosh computers?
- 2) Can I install Mac OS 7.6 (the general release) onto my PowerBook 3400 series computer?
- 3) Question: When I "Get Info" from the File menu on the System File in my PowerBook 3400 computer's System Folder it says it is version 7.5.3. Is this a mistake? I thought it was supposed to be running Mac OS 7.6.
- 4) Will I be able to install newer Macintosh system software versions and/or Mac OS updates onto my PowerBook 3400 series computer?
- 5) Question: Why do I get a dialog box when I restart my machine stating that, "QuickTime MPEG Extension did not load. It requires the Thread Manager extension or ThreadsLib extension (version 2.1.5 or later)"?
- 6) Why does my PowerBook 3400 series computer sometimes freeze/hang when I cancel a software installation?
- 7) Why can I not print some of the user manuals (.pdf files) any more? They used to print with no trouble.
- 8) Why does the sound from the right speaker of my PowerBook 3400 computer sound louder than the sound from the left speaker when I'm using the built-in modem that came with the computer?
- 9) Why can I not use the Speed access part of Speed Doubler version 2.x with System 7.6?

DISCUSSION -----

1) Question: Can the PowerBook 3400 Series CD install Mac OS 7.6 onto my desktop Power Macintosh computers?

Answer: No, the PowerBook 3400 series CD is specifically intended for use the PowerBook 3400 series of computers only. Although some past model-specific CDs have allowed installation on other computers, the PowerBook 3400 Series CD installer is set up to install only onto PowerBook 3400 series computers.

2) Question: Can I install Mac OS 7.6 (the general release) onto my PowerBook 3400 series computer?

Answer: No, the PowerBook 3400 series computers require additional software that is available only from the version of Mac OS 7.6 that shipped with these computers. The General Release of Mac OS 7.6 does not contain this *software*.

Note: The PowerBook 3400 Enabler among several other files is not included in the general release version of Mac OS 7.6 and the PowerBook cannot operate properly without this file.

3) Question: When I "Get Info" from the File menu on the System File in my PowerBook 3400 computer's System Folder it says it is version 7.5.3. Is this a mistake? I thought it was supposed to be running Mac OS 7.6.

Answer: The version number in the Get Info window is correct. The PowerBook 3400 series computers are running a version of Mac OS 7.6 that was created especially for the PowerBook 3400 series computers. Although the "packaging" is a little different, the operating system itself is the same with some specific files added for this computer.

For the technically inclined: The same code is being executed at run time, but on the PowerBook 3400 series computers, the newer system code runs from the PowerBook 3400 Enabler file rather than from the System File.

4) Question: Will I be able to install newer Macintosh system software versions and/or Mac OS updates onto my PowerBook 3400 series computer?

Answer: Yes, when Apple releases an update to the system software, you should be able to install it on your PowerBook 3400 series computer.

5) Question: Why do I get a dialog box when I restart my machine stating that, "QuickTime MPEG Extension did not load. It requires the Thread Manager extension or ThreadsLib extension (version 2.1.5 or later)"?

Answer: It is possible that you have removed or altered the pre-installed System

folder that was installed on your PowerBook 3400 series computer. If you have installed just the system software required (Mac OS 7.6 for PowerBook 3400 series), the Thread Manager extension is deleted because the functionality was rolled into the system file. Unfortunately, a newer version of the Thread Manger extension is needed by the QuickTime MPEG software. To remedy the situation, reinstall the QuickTime MPEG software. The QuickTime MPEG installer is available on the PowerBook 3400 Series CD in the Apple Extras folder.

6) Question: Why does my PowerBook 3400 series computer sometimes freeze/hang when I cancel a software installation?

Answer: It is possible that this freeze could be caused by having an old version of the ObjectSupportLib file installed. There are some third party applications that install an older version of ObjectSupportLib file in to the Extensions Folder. The older versions can cause the computer to hang when the Finder is restarted. This is a general system software issue, not one specific to the PowerBook 3400 series computers. The correct version that you need is ObjectSupportLib version 1.1.8. This version is installed by the PowerBook 3400 System Software Installer.

7) Question: Why can I not print some of the user manuals (.pdf files) any more? They used to print with no trouble.

Answer: The pre-installed software bundle on the PowerBook 3400 series computers is set up so that you can print and view Adobe Acrobat files. If you choose to erase the bundle and install just the system software, you have to install Adobe Acrobat Reader as well in order to view and print the .pdf manual files. The Adobe Acrobat Reader installer is located in the Install Applications folder on the CD.

8) Question: Why does the sound from the right speaker of my PowerBook 3400 computer sound louder than the sound from the left speaker when I'm using the built-in modem that came with the computer?

Answer: When the modem portion of the internal dual Ethernet/33.6 modem card is in use (online) or is waiting for a fax call it will attenuate (decrease the output to) the left channel sound level by 50 percent. This happens because the modem only drives the left channel and it is connected to the sound circuitry when the modem software is active. The balance control in the Monitors & Sound control panel may be used to restore the sound balance if desired during modem use.

9) Question: Why can I not use the Speed access part of Speed Doubler version 2.x with System 7.6?

Answer:

****IMPORTANT NOTE:**** This information comes from a Connectix press release, the makers of Speed Doubler.

There is a problem which is usually triggered by using the Find function within the Mac OS Finder. Usually, the result is that the display within the Find results dialog box is missing the found information. Sometimes, after using Find, if you move, delete, or create new files. This problem can result in disk directory corruption.

Because of the potential seriousness of this issue, Connectix recommends that all customers using Mac OS 7.6 with Speed Doubler 2.0 do one of the following things:

- 1) Update to Speed Doubler version 2.0.1 - download from the web at:
<http://www.connectix.com/connect/update.html>

-OR-

- 2) Turn off "Faster Disk Performance" in the Speed Doubler 2.0 Control Panel.

If you are using Speed Doubler version 1.x and Mac OS 7.6, you should remove your Speed Access extension entirely.

4) Question: Will I be able to install newer Macintosh system software versions and/or Mac OS updates onto my PowerBook 3400 series computer?

Answer: Yes, when Apple releases an update to the system software, you should be able to install it on your PowerBook 3400 series computer.

5) Question: Why do I get a dialog box when I restart my machine stating that, "QuickTime MPEG Extension did not load. It requires the Thread Manager extension or ThreadsLib extension (version 2.1.5 or later)"?

Answer: It is possible that you have removed or altered the pre-installed System folder that was installed on your PowerBook 3400 series computer. If you have installed just the system software required (Mac OS 7.6 for PowerBook 3400 series), the Thread Manager extension is deleted because the functionality was rolled into the system file. Unfortunately, a newer version of the Thread Manger extension is needed by the QuickTime MPEG software. To remedy the situation, reinstall the QuickTime MPEG software. The QuickTime MPEG installer is available on the PowerBook 3400 Series CD in the Apple Extras folder.

6) Question: Why can I not print some of the user manuals (.pdf files) any more? They used to print with no trouble.

Answer: The pre-installed software bundle on the PowerBook 3400 series computers is set up so that you can print and view Adobe Acrobat files. If you choose to erase the bundle and install just the system software, you have to install Adobe Acrobat Reader as well in order to view and print the .pdf manual files. The Adobe Acrobat Reader installer is located in the Install Applications folder on the CD.

7) Question: Why does the sound from the right speaker of my PowerBook 3400 computer sound louder than the sound from the left speaker when I'm using the built-in modem that came with the computer?

Answer: When the modem portion of the internal dual Ethernet/33.6 modem card is in use (online) or is waiting for a fax call it will attenuate (decrease the output to) the left channel sound level by 50 percent. This happens because the modem only drives the left channel and it is connected to the sound circuitry when the modem software is active. The balance control in the Monitors & Sound control panel may be used to restore the sound balance if desired during modem use.

8) Question: Why can I not use the Speed access part of Speed Doubler version 2.x with System 7.6?

Answer:

****IMPORTANT NOTE:**** This information comes from a Connectix press release, the makers of Speed Doubler.

There is a problem which is usually triggered by using the Find function within the Mac OS Finder. Usually, the result is that the display within the Find results dialog box is missing the found information. Sometimes, after using Find, if you move, delete, or create new files. This problem can result in disk directory corruption.

Because of the potential seriousness of this issue, Connectix recommends that all customers using Mac OS 7.6 with Speed Doubler 2.0 do one of the following things:

- 1) Update to Speed Doubler version 2.0.1 - download from the web at:

<http://www.connectix.com/connect/update.html>

-OR-

- 2) Turn off "Faster Disk Performance" in the Speed Doubler 2.0 Control Panel.

If you are using Speed Doubler version 1.x and Mac OS 7.6, you should remove your Speed Access extension entirely.

9) Question: Can I add RAM to a PowerBook 3400 computer the same way it is added in a PowerBook 1400 - stacked on top of each other? Can I use RAM made for a PowerBook 5300 in a PowerBook 3400?

The PowerBook 3400 does NOT support "piggy-back" RAM cards like those that can be used in a PowerBook 1400. All PowerBook 3400 configurations ship with 16 MB soldered on the logic board and one open memory slot for expansion. A single card of up to 128 MB in size can be put in the slot for a total of up to 144 MB of RAM.

RAM cards designed for a PowerBook 5300 are not compatible with the PowerBook 3400. The connector for the RAM expansion card on a PowerBook 3400 logic board is rotated 180 degrees from that of the PowerBook 5300.

This article was published in the Information Alley on 20 February 1997.

Article Change History:

11 Apr 1997 - Edited for technical accuracy.
03 Mar 1997 - Added info about RAM.
26 Feb 1997 - Updated info about ObjectSupportLib file.

PowerBook 3400 Series: General Usage Tips (2/97)

Revised: 2/24/97
Security: Everyone

PowerBook 3400 Series: General Usage Tips (2/97)

=====

Article Created: 21 February 1997

TOPIC -----

The following article contains some general tips for using your PowerBook 3400 series computer. Topics covered include the following:

- * Infrared Related Information
- * Media Bay-Related Information
- * PC Card-Related Information
- * Serial Port Related Information
- * Video/Graphics Related Information

DISCUSSION -----

Infrared Related Information

=====

* For best performance when using the infrared networking capabilities (IrDA) of the PowerBook 3400 series computers turn ON Virtual Memory.

* GeoPort modems and IrTalk do not work together. In other words, you should not attempt to transfer files over IrTalk while using a GeoPort modem.

Media Bay-Related Information

=====

Hot Swapping Devices

It is critical for PowerBook 3400 series computer owners to understand that they should NEVER remove the media bay device when it is in use. Any time that the light is on or flashing, the media bay device should not be removed. Failure to heed this warning can result in a system crash and/or data loss.

Problem

The computer freezes/hangs when a CD is placed into the CD tray.

Resolution

If you put a CD into the CD-ROM drive tray and only partially close it, the CD-ROM drive attempts to scan the CD, but it cannot, so the system may hang.

If the CD remains in this position, after restarting you will see a blank gray screen instead of "Welcome to Macintosh" dialog because the CD is interfering with the startup process. To get out of this situation, the CD must either be removed, or completely inserted. Then you can restart the computer in the regular fashion.

Problem

Vibration of the CD-ROM drive

Resolution

All higher speed CD-ROM drives are sensitive to unbalanced CDs. The reason is that the speed at which the CD is rotating is fast enough that even the slightest bit of extra weight (like excessive silkscreen ink on one half of the CD or an address-type label on one side of the CD) will cause the CD to make a rattling sound.

Because of this sensitivity of these high speed CD-ROM drives it is very important for you to refrain from placing labels onto your CDs.

* Note: This is not a PowerBook 3400 computer-specific issue. This information applies to all high-speed CD-ROM drives.

PC Card-Related Information

=====

Existing multi-function cards (for example, combined modem and networking cards) may not work in PowerBook 3400 computers if you do not install a new/updated software driver from the developer of the that specific third party PC card.

Network-Related Information

=====

Problem

User cannot see zones when connected to a network using Ethernet.*

Resolution

One reason this may happen is that the user's Node ID is no longer valid. If this is the case, you can perform the following steps to make the network zones accessible:

1. Open the AppleTalk Control Panel.
2. Select User Mode from the Edit menu.
3. Click the Advanced radio button (to get into the advanced user mode) and click OK.
4. Click the User defined check box.
5. Find out from your network administrator what the network range numbers are.
6. Select a Network number within the network range that is displayed.
7. Select a different Node ID (between 1 and 256)
8. Close the control panel and Save changes.
9. Sometimes you may get a dialog box at this point stating that the Node ID is in use by someone else. In this case, you need to select a different Node ID. Repeat steps 7 and 8 until a valid number is selected (usually once or twice).

* Note: This is not a PowerBook 3400 specific issue. This situation could occur on any Macintosh or Power Macintosh computer.

Serial Port Related Information =====

The PowerBook 3400 series of computers has the same serial chip as Power Macintosh 5400 and 6400 series computers, hence they may encounter some of the same serial port related issues.

If you have a serial device that does not function properly with your PowerBook 3400 series computer, you should contact the vendor of that device for more information. It is possible that the manufacturer of your serial device may have written a new software driver for Mac OS 7.6 or the specifically for the PowerBook 3400 computer.

Video/Graphics Related Information =====

Question: When I start up with an AppleVision monitor* connected to my PowerBook 3400 series computer, the display on the external monitor is not centered at first. Then, during the startup process, the image on the screen jumps and is correctly centered. Is my PowerBook computer or my AppleVision display defective? What is going on?

Answer: No, your PowerBook computer and your display are working fine. What you are seeing is a correction to the timing that is being driven from your PowerBook computer to your external display.

At startup, the timing that is driven to a display when it is in simulscan mode is not exactly what the monitor expects. Once the system starts to load, the timing adjusts so that it is centered correctly on your screen.

There is nothing wrong with your PowerBook computer or monitor. This anomaly will not damage your PowerBook computer or monitor. You could use the horizontal and vertical controls on the monitor to adjust the initial screen so that it is centered, but it is not necessary.

* Note: This could happen with other VGA or Apple displays as well, but only in the 800x600, 60Hz (Simulscan) timing.

Problem

An external VGA device is not working properly with a PowerBook 3400 series computer.

Information

PowerBook 3400 series computers sense external multi-sync VGA displays by detecting whether or not pin 11 on the video connector is grounded. Most VGA monitor manufacturers are compliant with the VESA specification and they do ground this pin. However, some devices do not have this pin grounded.

By using a VGA->Macintosh adapter along with the Macintosh->VGA adapter (supplied with your PowerBook 3400 series computer) it is possible to get the 640x480x67hz mode to work, but you will not be able to access the VGA modes (800x600 and 1024x768).

NOTE: For more information about using a third-party VGA display with your PowerBook 3400 series computer, you should contact the vendor who manufactures and supports that display.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Color LW 12/600 PS: Successful Transparency Printing (2/97)

Revised: 2/21/97
Security: Everyone

Color LW 12/600 PS: Successful Transparency Printing (2/97)

=====

Article Created: 21 February 1997

TOPIC -----

What suggestions do you have for printing transparencies on the Color LaserWriter 12/600 PS and 12/660 PS? I regularly experience transparency jams that I would like to eliminate.

DISCUSSION -----

In order to optimize the print quality when printing transparencies the Color LaserWriter 12/600 PS and 12/660 PS require a special transparency material.

The Color LaserWriter uses a photosensor to detect the presence of the special transparencies by looking for a white paper tape strip at the leading edge of the transparency. When the white tape strip is detected the printer enters into the transparency mode. If standard transparencies are used (which do not contain the white tape strip) or if the transparency is not placed correctly into the printer, then a paper jam error is displayed on the status panel.

Before assuming that a hardware failure has occurred with the printer consult the Color LaserWriter 12/600 PS user's manual and review the following precautions to reduce jamming problems when printing on transparencies:

- Use only transparencies designed for use with the Color LaserWriter 12/600 PS (Apple part number M3876G/A).
- DO NOT print transparencies from the 250 sheet cassette, print only from the multipurpose tray.
- Insert Color LaserWriter transparencies into the multi-purpose tray with the white tape strip facing up and oriented so that the white tape strip end of the transparency enters the printer first. Note: Some Apple transparencies may have the word Apple printed on the white tape strip.

Carefully following these steps will help ensure problem-free printing.

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

LaserWriter Utilities for Windows: Models Supported (2/97)

Revised: 2/22/97
Security: Everyone

LaserWriter Utilities for Windows: Models Supported (2/97)

=====

Article Created: 22 February 1997

TOPIC -----

I want to change the configuration of a LaserWriter from my PC. Can you tell me which LaserWriters are supported by the Apple LaserWriter Utility for Windows and which LaserWriters are supported by the Apple Printer Utility for Windows?

DISCUSSION -----

Here is a listing of the printers supported by the two utilities:

Apple LaserWriter Utility for Windows

- LaserWriter 12/640 PS
- LaserWriter 16/600 PS
- LaserWriter Pro 630
- LaserWriter Pro 600
- LaserWriter Select 360

NOTE: Future monochrome LaserWriters that offer printing from the PC environment will be supported by the Apple LaserWriter Utility.

Apple Printer Utility for Windows

- Color LaserWriter 12/600 PS
- Color LaserWriter 12/660 PS

NOTE: Future color LaserWriters that offer printing from the PC environment will be supported by the Apple Printer Utility.

AMT 2.1.1 Titles for Windows Are 16-bit Applications (2/97)

=====

Article Created: 24 February 1997

TOPIC -----

Will the titles I create with Apple Media Tool (AMT) 2.1.1 for the Windows platform be 16- or 32-bit applications?

DISCUSSION -----

AMT Titles for the Windows platform are still 16-bit applications. This is so both Windows 3.1 and Windows 95 can be supported.

Power Macintosh 9600/233: Specifications (2/97)

Revised: 2/24/97
Security: Everyone

Power Macintosh 9600/233: Specifications (2/97)

Article Created: 24 February 1997

TOPIC -----

This article contains the technical specifications for the Power Macintosh 9600/233 computer.

DISCUSSION -----

Processor

=====

- * 233-MHz PowerPC 604e microprocessors
- * Integrated floating-point unit and 64K cache
- * Processor is mounted on a removable card for easy upgrades

Memory

=====

- * 32 MB of RAM, expandable to 768 MB via 12 DIMM sockets
- * 4 MB of ROM
- * 512K level 2 cache

Disk drives

=====

- * Internal 4GB Fast SCSI hard disk
- * Internal Apple SuperDrive floppy disk drive
 - Accepts high-density 1.4MB disks and 800K disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal 12x-speed CD-ROM drive
- * Expansion bays for additional storage devices—four 5.25-inch removable bays, three internal bays (open bays vary with configurations)

Interfaces

=====

- * Six PCI expansion slots compatible with PCI 2.0-compliant cards
- * Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and

GeoPort cables

- * 10BASE-T and AAUI-15 Ethernet connectors; optional PC Compatibility Cards provide multinode support for simultaneous network connections
- * Internal Fast SCSI bus (up to 10MB/s)
- * External SCSI bus (up to 5MB/s)
- * Apple Desktop Bus (ADB) expansion port
- * Mini jacks for stereo audio input and output
- * DB-15 connector for monitor (on accelerated graphics card)

Graphics support (configured through accelerated graphics card)

=====

- * 4 MB of VRAM
- * Support for display resolutions of up to 1,600 by 1,200 pixels with Apple Multiple Scan 20 Display
- * Support for display resolutions of up to 1,280 by 1,024 pixels
- * 24-bit color up to 1,152- by 870-pixel resolution
- * Refresh rate of up to 75 Hz

GeoPort telephony (Requires GeoPort Telecom Adapter Kit)

=====

- * 28.8-Kbit/s modem support
- * V.17 fax support
- * Speakerphone and answering-machine capability

Clock/calendar

=====

- * Custom integrated circuit with long-life battery

Keyboard and mouse

=====

- * Includes AppleDesign keyboard and ADB Mouse II

Electrical requirements and compliance

=====

- * Line voltage: 100 to 125/200 to 240 V AC, RMS single phase, automatically configured
- * Frequency: 50 to 60 Hz, single phase
- * Power: 390 W maximum, not including display

ADB power requirements

=====

- * Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- * Mouse draws 10 mA
- * Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

=====

- * Height: 17.3 in. (44.0 cm)
- * Width: 9.7 in. (24.6 cm)
- * Depth: 17.3 in. (44.0 cm)
- * Weight: 35.0 lb. (15.9 kg)

Environmental requirements

=====

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95% noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Power Macintosh 9600/233: Description (2/97)

Revised: 2/24/97
Security: Everyone

Power Macintosh 9600/233: Description (2/97)

=====

Article Created: 24 February 1997

TOPIC -----

This article contains the description for the Power Macintosh 9600/233 computer.

DISCUSSION -----

The Apple Power Macintosh 9600/233 system is--quite simply--the highest-performance Macintosh available today. In addition, because this computer features the innovative tower design that characterizes the 9600 line, it makes system access for upgrades or other servicing a stunningly simple process. So whether you're a publishing professional, a multimedia master, or simply someone who enjoys existing on technology's cutting edge, you'll find that this sophisticated system can help you do exactly what you want to do--easily, effectively, and extraordinarily efficiently.

The efficiency comes from the new level of processing speed that the Power Macintosh 9600/233 adds to the versatile built-in capabilities and flexible expansion options that earned the earlier systems in this series their reputation for excellence. Expressly designed to meet the needs of the most demanding users, the Power Macintosh 9600/233 features a 233-megahertz PowerPC 604e processor--the current top of the line for this advanced, RISC-based processor series. And the out-standing processor performance is backed by the kinds of features that the most discerning users value most--such as a 12x-speed CD-ROM drive for fast, easy access to CD-ROM-based materials, and, in particular, the outstanding flexibility afforded by six industry-standard, high-performance Peripheral Component Interconnect (PCI) expansion slots. (This flexibility includes the option of configuring the system to provide hardware-level compatibility with the PC world with the addition of either of two PC Compatibility Cards available from Apple.)

The growing movement toward Internet/intranet technology is making communications capabilities increasingly important, and the Power Macintosh 9600/233 not only supports both 10BASE-T and AUI Ethernet connections, but also

comes with a complete, comprehensive set of Internet access software.

So if you need--or simply want--a Macintosh system that's optimized for high performance and versatile capabilities, the Power Macintosh 9600/233 is the system for you.

Features

=====

Top-of-the-line performance

- * 233-MHz PowerPC 604e processor
- * Built-in floating-point processor and 64K cache
- * 512K level 2 cache
- * Accelerated graphics card

Communications and multimedia

- * Two high-speed serial ports compatible with GeoPort devices and LocalTalk cables
- * 12x-speed CD-ROM drive
- * 16-bit stereo audio input and output
- * Support for speech-recognition and text-to-speech capabilities

Expandability

- * Removable processor card allows easy upgrades
- * Six industry-standard PCI expansion slots
- * Dual-channel SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- * Internal expansion bays for additional storage devices (3.5-inch and 5.25-inch)

Compatibility

- * Includes 10BASE-T and AAUI Ethernet connectors
- * Supports Open Transport networking software (TCP/IP and AppleTalk)
- * Runs 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- * Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- * Runs MS-DOS and Windows applications via either of two optional PC Compatibility Cards from Apple
- * Comes with all of the software required for Internet access

System 7.5.5 software

- * Makes working with different applications consistent, so they're easier to learn and use
- * Allows easy customization of your Macintosh to reflect the way you work
- * Provides active assistance in learning new features with Apple Guide
- * Includes MacLinkPlus file translation software from DataViz

Ordering Information

=====

Power Macintosh 9600/233

Order No. M5883LL/A

* Power Macintosh 9600/233 computer with 32 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 4GB hard disk drive, an internal 12x-speed CD-ROM drive, and a PlainTalk microphone. Includes keyboard; mouse; system software version 7.5.5 or later; Internet access soft-ware; complete setup, learning, and reference documentation; and

PC Compatibility Card Solutions

* PC Compatibility Card with Pentium 100-MHz processor

Order No. M4092LL/A

* PC Compatibility Card with 100-MHz 586 processor

Order No. M4091LL/C

GeoPort Telecom Adapter Kit

Order No. M5438LL/A

CFM-68k Runtime Enabler 4.0b1 Public Beta Read Me (2/97)

Revised: 2/24/97
Security: Everyone

CFM-68k Runtime Enabler 4.0b1 Public Beta Read Me (2/97)

=====

Article Created: 24 February 1997

TOPIC -----

This article is the CFM-68k Runtime Enabler Public Beta 4.0b1 ReadMe file.

DISCUSSION -----

CFM-68k Runtime Enabler Public Beta

Apple has made available the CFM-68k Runtime Enabler v4.0b1 extension for testing purposes. It is critical that you read this document before choosing to install this beta software. If you do choose to accept the risk of running this beta software, it is important that you carefully follow the installation instructions listed at the end of this document.

WARNING:

The CFM-68k Runtime Enabler v4.0b1 is "beta software"; it is not the finished version of CFM-68k Runtime Enabler v4.0. This software has been provided for test purposes only and is not supported by Apple Computer.

WARNING:

The CFM-68k Runtime Enabler v4.0b1 extension is provided on an as-is basis. It is not warranted to be free from errors. It may cause significant problems with your computer and with other software you have installed.

WARNING:

Because this software is not warranted to be free from errors, you should not use it on any computer which is used for mission critical functions. You should also not use on any computer which contains data you consider irreplaceable. Should you choose to use this software, Apple Computer is not liable for any damages which may result.

WARNING:

Do not use the CFM-68k Runtime Enabler v4.0b1 extension with versions of the ObjectSupport Lib extension earlier than 1.2. Version 1.2 of the

ObjectSupportLib extension is included with this software.

WARNING:

Do not use Cyberdog v 1.2, 1.2.1, or 2.0 Alpha with this extension. There is an incompatibility between these versions of Cyberdog and the 4.0 version of the CFM-68k Runtime Enabler. This problem will be fixed in an upcoming version of Cyberdog which Apple expects to release shortly. When it is released, you can download it from the Cyberdog page at <http://cyberdog.apple.com>.

IMPORTANT:

The CFM-68k Runtime Enabler v4.0b1 extension will expire on May 1, 1997.

Support and Feedback

Technical Support: Do NOT call Apple technical support or the Apple Assistance Center with questions, comments, or problem reports about the CFM-68k Runtime Enabler v4.0b1.

Providing Feedback to Apple: If you wish to provide Apple with feedback about this beta software, a link to the feedback form can be found at <http://www.macos.apple.com/macos/cfm/cfmbeta.html>. Apple does not guarantee any response to messages you send. No technical support for the CFM-68k Runtime Enabler v4.0b1 extension is available.

Frequently Asked Questions

What is the CFM-68k Runtime Enabler extension? This extension allows applications to share code libraries on computers using a 680x0 processor. A shared code library is a file which contains common programming routines. By using shared libraries, applications can reduce their memory requirements.

What version of system software is required? You must have at least System 7.1 installed to use this software. This software also works with System 7.5, System 7.5.1, System 7.5.2, System 7.5.3, System 7.5.5, and Mac OS 7.6.

What is the problem with the CFM-68k Runtime Enabler extension? In late November, Apple announced a bug in the CFM-68k Runtime Enabler extension. This bug could cause random crashes and hangs, resulting in application instability and potential loss of data. Because of the potential seriousness of these problems, Apple has recommended that customers disable the extension.

What happens when the extension is disabled? If the CFM-68k Runtime Enabler extension is disabled, software which requires it will no longer run. This includes OpenDoc, Cyberdog, LaserWriter 8.4, the Apple Media Tool, AOL 3.0, and Microsoft Internet Explorer 3.0.

Does this updated CFM-68k Runtime Enabler v4.0b1 extension fix this bug? Apple has reasonable expectations that this extension fixes the bug. It has undergone significant testing for Apple to determine that it is reasonably stable. However, keep in mind that this is beta software, and has not completed all of Apple's quality testing.

When will Apple release the final version of this extension? Apple expects to release the final version in mid-March. No guarantee is given, however, that Apple will meet this ship date.

ObjectSupportLib version 1.2 is included with this software. Is this also beta software? No. ObjectSupportLib is officially released software. It is not beta software. Apple includes this software to install along with the CFM-68k Runtime Enabler v4.0b1 because of problems using older versions of ObjectSupportLib with the CFM-68k Runtime Enabler.

My computer uses a PowerPC processor. Should I install this software? No. Computers using a PowerPC processor do not need this extension. It is only for computers using the 680x0 processor.

How can I tell if my computer has a 680x0 processor? If your Macintosh model number is three digits long, then typically it has a 680x0 processor. For example, the Quadra 950, PowerBook 520, and Performa 600CD all have a 680x0 processor. By contrast, the Power Macintosh 6100, PowerBook 1400, and Perform 6320 all have a PowerPC processor.

Installation Instructions

You must install two extensions to use this software. Follow these instructions carefully.

1. If you have any critical data on your hard disk, you should back it up before installing this software.
2. Make sure you are in the Finder by clicking on the application menu in the upper-right corner of your screen and selecting Finder.
3. Locate your System folder and double-click it to open it.
4. Double-click on your Extensions folder to open it.
5. If the extension " CFM-68k Runtime Enabler" (note that this begins with a space) exists in your Extensions folder, drag it to the trash.
6. If the extension "ObjectSupportLib" exists in your system folder, drag it to the trash.
7. Close your Extensions window and System folder window.
8. Locate the folder "CFM-68k beta software" and double-click it to open it.
9. Select the extensions " CFM-68k Runtime Enabler" (note that this begins with a space) and "ObjectSupportLib" in the "CFM-68k beta software" folder and drag them over your System folder. Click OK when asked if you want to put them in your Extensions folder.
10. Restart your computer.

Article Reviewed/Updated: 13 March 1997

TOPIC -----

I recently purchased a Power Macintosh 8600/200 computer, and I attempted to install Mac OS 7.6 on it. However, a dialog box appeared stating that the new OS was not supported on this computer. How can I use Mac OS 7.6 on this computer?

DISCUSSION -----

The recently introduced Power Macintosh computers ship with either System 7.5, version 7.5.3 (Power Macintosh 4400/200) or System 7.5, version 7.5.5 (Power Macintosh 5500, 6500, 7300, 8600, and 9600 series computers).

None of these systems support Mac OS 7.6, and Mac OS 7.6 will NOT install on Power Macintosh 4400, 5500, 6500, 7300, 8600, or 9600 computers.

Instead, a coupon was included in the box will to allow you to upgrade to the "upgrade to 7.6" once it becomes available. The cost of the upgrade is \$9.95 (the cost of shipping/handling) plus any applicable sales tax.

IMPORTANT: If the coupon included with your computer states that the price is \$24, this is incorrect. Revised coupons with the new, lower price are expected to be available very shortly.

If you have one of these computers and would like to obtain a Mac OS Up-to-Date Coupon contact one of the following sources:

- Mac OS Up-to-Date Customer Service: 1-800-335-9258
- AppleFax: 1-800-462-4396 (You should order a Fulfillment Coupon (doc. # 11438) and a List of Qualifying Computer (doc. # 11437).

Power Macintosh 5400/200: Description (2/97)

=====

Article Created: 24 February 1997

TOPIC -----

This article contains a description of the Power Macintosh 5400/200.

DISCUSSION -----

The Power Macintosh 5400/200 is a convenient, highly economical, all-in-one system. It combines high-performance features designed to enhance productivity with multimedia capabilities and Internet access tools that make using technology to improve the educational experience easier than ever before.

The Power Macintosh 5400/200 Color System includes Power Macintosh 5400/200 (24/1.6GB/256K L2 cache) with built-in 15-inch (12.8-inch diagonal viewable image size) multiple-scan color display, 8x-speed CD-ROM drive, built-in Ethernet, stereo speakers, microphone, AppleDesign Keyboard, and mouse.

Enhance the Educational Experience-and Productivity

=====

Innovative educators know that students learn best when they're actively engaged-and multimedia learning activities are uniquely engaging. With its high-quality stereo sound, advanced color display, and built-in 8x-speed CD-ROM drive, the Apple Power Macintosh 5400/200 makes it easy to take advantage of the wealth of existing educational multimedia materials on CD-ROM, as well as to develop multimedia projects of your own. In fact, this powerful computer even lets you install optional video-input/output capabilities and comes with a bay that can accommodate an optional TV/FM radio tuner¹, so you can easily opt to further enhance the teaching and learning experience through multimedia. In addition, with its 200-megahertz PowerPC 603e processor, the Power Macintosh 5400/200 brings high performance to educational computing. And this processing speed is complemented by the system's built-in Ethernet connection, for high-speed networking.

Easy Access to the Internet

=====

Speaking of networking, every day, more and more schools are discovering the educational value of access to the Internet-with its vast wealth of informational resources and communications opportunities. The Power Macintosh 5400/200 makes it easy to join their ranks, because it comes with a CD containing all the software you need for Internet access. (Modem or direct connection to the Internet is required. Access fees from Internet service provider are extra.) So you and your students can use this computer to do everything from "surfing the net" for news on current events to using Internet-based electronic mail and bulletin boards to collaborate on projects with geographically distant peers. It can even run Apple's innovative Cyberdog software, which lets you tailor access to the Internet to enhance its educational utility-for example, by creating computer-based curriculum materials that contain actual live links to appropriate web sites.

Flexible Expansion Capabilities to Take You into the Future

=====

To accommodate educators' future concerns, the Power Macintosh 5400/200 features the Peripheral Component Interconnect (PCI) expansion bus architecture, which makes it easier-and more affordable-than ever to customize your system for optimal utility. For example, you could add Avid Cinema-a package that consists of a PCI card, accompanying software, and connector cables-which enables simple, straightforward video creation and editing on the desktop. The possibilities are nearly limitless-and they're growing, because more PCI cards are becoming available all the time.

The Power Macintosh 5400/200-everything you need in an educational computer, at an economical price.

Macintosh Advantages

=====

Because they're so easy to set up, learn, use, and expand, Macintosh computers let schools accomplish more, in less time and with less effort, than other computers. And Power Macintosh computers offer new levels of performance and advanced applications.

It's a Great Value

The Power Macintosh 5400/200 is Apple's economical, all-in-one computer designed expressly for education. This flexible, convenient workstation can help schools get more out of their computing budgets in the short term, while providing room to grow in the future. You should also keep in mind that, over the long term, Macintosh computers consistently cost less than PCs because they require less training, maintenance, and support.²

Schools Can Do More with Macintosh

Like all Macintosh computers, the Power Macintosh 5400/200 runs thousands of applications, including productivity, reference, resource, and administration tools. You can do more with Macintosh computers because more top-rated education software runs on Macintosh.³

It's Easy to Use

Because the Power Macintosh 5400/200 features an all-in-one design that makes it incredibly easy to set up, you can start using it to do productive work as soon as you take it out of the box. And it's easy to learn to use new applications, because all Macintosh software works in the same intuitive fashion.

It's Ideal for Multimedia

The Power Macintosh 5400/200 has advanced multi-media features built in-so you can get involved with every aspect of this exciting new technology. Teachers and students can take advantage of the built-in multi-media capabilities to create compelling presentations as well as to work with existing multimedia courseware.

Features

=====

Power and Speed

-
- * 200-MHz PowerPC 603e processor
 - * Standard 256K level 2 cache
 - * Built-in high-speed Ethernet connection (twisted-pair)

Memory and Storage

-
- * 24 MB of RAM, expandable to 136 MB (8 MB on the logic board and two DIMM slots, one occupied by a 16 MB DIMM)
 - * Apple SuperDrive floppy disk drive (reads and writes Mac OS, Windows, DOS, OS/2, and ProDOS files)
 - * Internal 1.6GB IDE hard disk drive
 - * Internal tray-loading 8x-speed SCSI CD-ROM drive

Display

-
- * 15-inch (12.8-inch diagonal viewable image size) multiple-scan color display
 - * 1 MB dedicated video RAM
 - * Supports 640 by 480 pixels and 800 by 600 pixels at 16 bits (thousands of colors)
 - * Supports 832 by 624 pixels at 8 bits (256 colors)
 - * 0.28-mm dot pitch

Expansion

-
- * PCI slot (accommodates industry-standard 6.88-inch/short cards)
 - * Optional Multimedia Features
 - * Optional video-out connector for connecting to an LCD projection panel or a second monitor
 - * Optional video-in card, so you can record video from a camcorder, VCR, or laserdisc
 - * Expansion bay included for optional TV/FM radio tuner

..TIL21012-Power_Macintosh_5400-200-Description_2-97_(TA36533).pdf

* Avid Cinema card and software for simple, straightforward digital video creation and editing on the desktop (available Spring 1997)

Features Built into Every Macintosh

=====

Usability

- * Runs thousands of Macintosh applications, including most top-rated curriculum programs and administrative software, as well as hundreds of applications optimized to take advantage of PowerPC processor technology
- * Is easy to set up, learn, use, and expand

System Software

- * Includes Apple Guide, Drag and Drop, AppleScript, Macintosh PC Exchange, Macintosh Easy Open, and more

Networking

- * Built-in AppleTalk networking
- * File sharing without a dedicated server

Ordering Information

=====

Power Macintosh 5400/200 (24/1.6GB/256K L2 cache) with built-in 15-inch (12.8-inch DVIS) multiple-scan color display, 8x-speed CD-ROM drive, Ethernet networking, stereo speakers, microphone, AppleDesign Keyboard, and mouse.

Power Macintosh 5500/225: Description (2/97)

Revised: 2/24/97
Security: Everyone

Power Macintosh 5500/225: Description (2/97)

Article Created: 24 February 1997

TOPIC -----

This article contains a description of the Power Macintosh 5500/225.

DISCUSSION -----

The Power Macintosh 5500/225 is a convenient, innovative all-in-one system. It combines high-performance features designed to enhance productivity with state-of-the-art multimedia capabilities and Internet access tools to offer a combination of performance, convenience, and outstanding value.

The Power Macintosh 5500/225 Color System includes Power Macintosh 5500/225 (32/2GB/256K L2 cache) with built-in 15-inch (12.8-inch diagonal viewable image size) multiple-scan color display, 12x-speed CD-ROM drive, built-in Ethernet, video-capture card, NTSC TV video-out connector, stereo sound, microphone, AppleDesign Keyboard, and mouse.

Come Up to a New Level of All-In-One Performance

All-in-one computers have always been convenient-and often economical-but today they're reaching new levels of performance. The advanced Apple Power Macintosh 5500/225 features one of the most powerful processors ever made available in a system developed for education: a 225-megahertz PowerPC 603e. This processing speed is complemented by the system's built-in Ethernet connection, for high-speed networking. And to ensure that the Power Macintosh 5500/225 can continue to meet your needs in the future, it offers an industry-standard PCI expansion slot.

Next-Generation Multimedia

Educational multimedia has been an Apple stronghold for years-ever since instructors first learned the educational value of its unique ability to engage students in the process of learning. The

Power Macintosh 5500/225 builds on Apple's legacy in this area by providing several innovative features designed to further enhance your multimedia capabilities. For example, it provides built-in 2D and 3D graphics acceleration, as well as a 12x-speed CD-ROM drive. In addition, the 5500/225 features a new kind of video-out capability-TV video-out, which allows for easy and instant connection to any video-in NTSC television. It also comes with a standard built-in video-in card and optional TV/FM radio tuner capabilities. And on the audio side, built-in stereo speakers offer rich digital sound quality.

Easy Access to the Internet

=====

In addition to multimedia, the other hot topic in education is the Internet. Every day, more and more schools are discovering the educational value of this amazing information and communications resource. The Power Macintosh 5500/225 makes it easy to join the ranks of the Internet world, because it comes with a CD containing all the software you need for Internet access. (Modem or direct connection to the Internet is required. Access fees from Internet service provider are extra.) You and your students can use this computer to do everything from "surfing the net" for news on current events to using Internet-based electronic mail and bulletin boards to collaborate on projects with geographically distant peers. It can even run Apple's innovative Cyberdog software, which lets you tailor access to the Internet to enhance its educational utility-for example, by creating computer-based curriculum materials that contain actual live links to appropriate web sites.

The Power Macintosh 5500/225-the next generation of advanced capabilities in a convenient, affordable all-in-one computer.

Macintosh Advantages

Power Macintosh 6500/225 & 6500/250: Description (2/97)

Revised: 4/21/97
Security: Everyone

Power Macintosh 6500/225 & 6500/250: Description (2/97)

Article Created: 24 February 1997

TOPIC -----

This article contains a description of the Power Macintosh 6500/225 and 6500/250.

DISCUSSION -----

The Power Macintosh 6500/225 and 6500/250 represent a new look in Apple Education computers: a space-saving modular tower design that combines superior-quality performance features designed to enhance productivity with state-of-the-art multimedia capabilities and Internet access tools to let you enjoy the advantages that top-of-the-line technology can bring to teaching and learning.

The Power Macintosh 6500/250 includes Power Macintosh 6500/250 (32/3GB/256K L2 cache) with IomegaZip drive, 12x-speed CD-ROM drive, built-in Ethernet, video-capture card, NTSC TV video-out connector, stereo sound, microphone, AppleDesign Keyboard, and mouse. (Monitor sold separately.)

Enjoy the State of the Art in Educational Computing Performance

Interested in a high-performance computer series that truly bridges the gap between the convenient all-in-one systems designed specifically for education and the flexible, modular desktop computers that are frequently used in businesses and universities? These advanced computers provide exactly that. And you can choose the precise display you want from the range of exciting solutions available from Apple. The Apple Power Macintosh 6500 series systems feature the most powerful processors ever offered by Apple in a system for education: a 225- or 250-megahertz PowerPC 603e. This processing speed is complemented by the built-in Ethernet connection for high-speed networking. To ensure that you can configure them to meet your needs in the future, the Power Macintosh 6500 series systems offer two industry-standard PCI expansion slots, a 2GB or 3GB hard disk, and an Iomega Zip drive that uses 100MB removable cartridges for easy file

sharing, transfer, and backup. And the two models in this series are designed to give you flexible purchase options: the Power Macintosh 6500/225 provides high-end performance for productivity tasks and multimedia activities, while the Power Macintosh 6500/250 adds advanced multimedia capabilities.

Next-Generation Multimedia

=====

Educational multimedia has been an Apple stronghold for years-ever since instructors first learned the educational value of its unique ability to engage students in the process of learning. The Power Macintosh 6500 series builds on Apple's legacy in this area by providing several innovative features. For example, both systems offer built-in 2D and 3D graphics acceleration, as well as a 12x-speed CD-ROM drive. In addition, the Power Macintosh 6500/250 features a new kind of video-out capability-TV video-out, which allows for easy and instant connection to any video-in capable NTSC television. It also comes with a built-in video-in card and optional TV/FM radio tuner capabilities. And on the audio side, when you plug in external speakers, the built-in speaker becomes a subwoofer.

Easy Access to the Internet

=====

In addition to multimedia, the other hot topic in education is the Internet. Every day, more and more schools are discovering the educational value of this amazing information and communications resource. The Power Macintosh 6500 series systems come with a CD containing all the software you need for Internet access. (Modem or direct connection to the Internet is required. Access fees from Internet service provider are extra.) You and your students can use these computers to do everything from "surfing the net" for news on current events to using Internet-based electronic mail and bulletin boards to collaborate on projects with geographically distant peers. They can even run Apple's innovative Cyberdog software, which lets you tailor access to the Internet to enhance its educational utility-for example, by creating computer-based curriculum materials that contain actual live links to appropriate web sites.

The Power Macintosh 6500 series-the next generation of advanced educational computing capabilities in a flexible, modular tower design.

Macintosh Advantages

=====

Because they're so easy to set up, learn, use, and expand, Macintosh computers let schools accomplish more, in less time and with less effort, than other computers. And Power Macintosh computers offer new levels of performance and advanced applications.

It's a great value.

The Power Macintosh 6500 series systems are flexible, modular workstations that take schools to the cutting edge of educational technology today, while providing room to grow in the future. You should also keep in mind that, over the long term, Macintosh computers consistently cost less than PCs because they require less training, maintenance, and support.

Schools can do more with Macintosh.

Like all Macintosh computers, the Power Macintosh 6500 series systems run thousands of applications, including productivity, reference, resource, and administration tools. You can do more with Macintosh computers because more top-rated education software runs on Macintosh.

It's easy to use.

Because the Power Macintosh 6500 series features a space-saving modular tower design along with Apple's famed plug-and-play ease of connection, you can choose to purchase the Apple display that fits your needs-while resting assured that you can simply plug it in and get started computing right away. And it's easy to learn to use new applications, because all Macintosh software works in the same intuitive fashion.

It's ideal for multimedia.

Both systems in the Power Macintosh 6500 series have advanced multimedia features built in-so you can get involved with every aspect of this exciting new technology. And the Power Macintosh 6500/250 features built-in video-in, as well as a new kind of video-out that lets you connect to an NTSC television with video-in. Teachers and students can take advantage of the built-in multimedia capabilities to create compelling presentations, as well as to work with existing multimedia courseware.

Macintosh Performa 6400: Apple Video Player Shows No Video(2/97)

Revised: 4/21/97
Security: Everyone

Macintosh Performa 6400: Apple Video Player Shows No Video(2/97)

Article Created: 24 February 1997
Article Reviewed/Updated: 25 February 1997

TOPIC -----

I have a Macintosh Performa 6400/200 with the Avid Cinema bundle. When I have the Apple Video Player application open and I am trying to capture video from a VCR, I hear the sound coming through the computer, but it does not play any video through. I either get a black screen or a still picture. If I choose Freeze, it will capture and display the current frame, but if I Unfreeze it, that image just stays there until I select Freeze again.

When trying to record video with Apple Video Player, I have received a -9402 error and sometimes the application quits with a "fatal error." What might be causing these problems?

DISCUSSION -----

Issue

The symptoms you are experiencing most likely the result of a conflict between the Apple Video Player application and the Avid Cinema Extension.

This situation can occur whether you are viewing from video tape or when you are using Apple Video Player to view the signal from a TV Tuner card.

These symptoms only appear if your display is set to 256 colors. The Apple Video Player application works as is expected when the display is set to Thousands of colors.

Details

The Macintosh Performa 6400 computer always digitizes in 16-bit mode. The problem arises when Apple Video Player tries to downsample from 16-bit to 8-bit. This is the root of the conflict between the Apple Video Player and the Avid Cinema Extension.

The built-in video in the Macintosh Performa 6400 only provides enough Video RAM (VRAM) for 256 colors at the 832x624 resolution. Because of the amount of VRAM your computer has, you need to change the resolution setting to 640x480 at 16-bit to make Apple Video Player work properly.

Workarounds

1) Change your display setting to Thousands of Colors by selecting this option in your Monitor & Sound control panel.

- or -

2) Disable the Avid Cinema Extension by de-selecting* it in your Extensions Manager control panel.

* NOTE: You will need to re-enable the Avid Cinema Extension before using the Avid Cinema application again.

For more information on other Cinema related issues, refer to the Tech Info Library article titled "Avid Cinema 1.0: Issues and Workarounds" (article number TECHINFO-0020614).

Apple Internet Connection Kit: AppleGuide Files (3/97)

Revised: 3/11/97
Security: Everyone

Apple Internet Connection Kit: AppleGuide Files (3/97)

=====

Article Created: 11 March 1997

TOPIC -----

I installed Apple Internet Connection Kit (AICK) 1.2. Before, I could use AppleGuide from the Apple Internet Dialer's Help menu to obtain usage information about AICK, now, I cannot do this. Yet I notice that there is a folder called "Guide Files" in the Internet Connection Kit folder. What gives?

DISCUSSION -----

Generally, for Guide files to be recognized, they must be in the same folder as the application they are to be used with.

AICK 1.1.5 comes with a solitary Guide file, "Apple Internet Conn Kit Guide." This was pre-installed in the Internet Connection Kit folder, at the same level as Apple Internet Dialer version 1.1.3.

AICK 1.2 comes with six Guide files. These are located in the Guide Files folder, which is in the Internet Connection Kit folder. They provide more information about how the various Internet clients which come with AICK 1.2 work. The files are:

- Apple Internet Conn Kit Guide
- NewsWatcher Guide Additions
- Emailer Guide Additions
- Navigator Guide Additions
- Fetch Guide Additions
- Telnet Guide Additions

To use these files, move them to the same folder as the Apple Internet Dialer. To access them, open the Apple Internet Dialer and choose "Apple Internet Connection Kit Guide" from the Help menu (the question mark in the top right corner of the screen). To see the various product categories, click on the Topics button, once AppleGuide launches.

..TIL21016-Apple_Internet_Connection_Kit-AppleGuide_Files_3-97_(TA36535).pdf

NOTE: Do not move the Guide Additions into the various client folders (for example, don't move the Navigator Guide Additions into the Netscape folder). They are designed for use with the Apple Internet Conn Kit Guide file, which can only be read by the Apple Internet Dialer.

AppleTalk: How do I Create Zones? (2/97)

Revised: 2/24/97
Security: Everyone

AppleTalk: How do I Create Zones? (2/97)

=====

Article Created: 24 February 1997

TOPIC -----

My AppleShare File Server documentation refers to AppleTalk zones in several places. How do I set up zones with AppleShare? Will this improve network performance?

DISCUSSION -----

AppleTalk Zones are created by AppleTalk routers, like the Apple Internet Router, to divide devices on one or more networks up into logical groups. For example, these groups can be geographical like the "third floor" or departmental like the "sales department." When no router is present, all devices are considered to be on the same zone.

AppleTalk Zones, in themselves, do not alleviate network traffic on a single network. To improve performance on a heavily-used network, consider dividing the network into two separate networks, and use routers and zones, if desired, to let devices on the two separate networks continue communicating with each other.

More information on setting up zones and networks with routers should be available in the router's documentation.

Mac OS-Based Computers Not Responding to Ping (2/97)

Revised: 2/25/97
Security: Everyone

Mac OS-Based Computers Not Responding to Ping (2/97)

=====

Article Created: 25 February 1997

TOPIC -----

I cannot ping a Mac OS-based computer from my PC until I run a TCP application on the Mac OS computer. I am trying to monitor when these computers are running, however, the users generally do not use TCP applications. How do I get the TCP/IP stack to initialize on startup?

DISCUSSION -----

For Open Transport

If Open Transport is being used, it can be configured to always have the protocol stack active by following the steps below:

- 1) Open the TCP/IP control panel.
- 2) Choose User Mode in the Edit menu, or use the keyboard shortcut Command-U.
- 3) Select Advanced or Administration and click OK.
- 4) Click the Options button in the TCP/IP control panel.
- 5) Select Active and deselect Load only when needed, then click OK.
- 6) Close the TCP/IP control panel and save changes.

For MacTCP

If Classic networking is being used, the protocol stack is only active when an application requiring MacTCP is active. The workaround is to have an application which uses MacTCP launch at startup by placing an alias of the application in the Startup Items folder inside the System Folder.

PC Compatibility Card: Specialty Cable Pinouts (2/97)

Article Created: 25 February 1997

TOPIC -----

This article lists the pinouts for the 7-Inch and 12-Inch PCI-based Apple PC Compatibility Cards specialty cable. This cable connects the DOS Compatibility Card to display devices. The article also has the pinouts for the card's on board 15-pin gameport.

DISCUSSION -----

Begin_Table

DB26 Connector Pin Assignments

=====

Pin number	Signal	Description
-----	-----	-----
1	MAC HSYNC	Macintosh horizontal synchronize
2, 4, 6, 8	GND	Logic ground
3	MAC BLUE	Macintosh blue signal
5	SENSE0	Sense line 0
7	BLUE OUT	Blue output from PCI card
9	HSYNC OUT	Horizontal synchronize output from PCI card
10	MAC CSYNC	Macintosh contrast synchronize
11, 13, 15,	GND	Chassis ground
17, 21, 24	GND	Chassis ground
12	MAC GREEN	Macintosh green signal
14	SENSE1	Sense line 1
16	GREEN OUT	Green output from PCI card
18	CSYNC OUT	Contrast synchronize output from PCI card
19	MAC VSYNC	Macintosh vertical synchronize
20	MAC RED	Macintosh red signal
22	CABLE DET L	Cable detect low
23	SENSE2	Sense line 2
25	RED OUT	Red output from PCI card

26 VSYNC OUT Vertical synchronize output from PCI card

DB15 Gameport Connector Pin Assignments

=====

Pin number	Signal	Description
-----	-----	-----
1, 8, 9	+5 V +5 V	power input
2	JOYF0 O	Joystick F0 output
3	JRC0 O A	x-axis control
4, 5	GND	Chassis ground
6	JRC1 O A	y-axis control
7	JOYF1 O	Joystick F1 output
10	JOYF2 O	Joystick F2 output
11	JRC2 O B	x-axis control
12	MIDI OUT O	MIDI output
13	JRC3 O B	y-axis control
14	JOYF3 O	Joystick F3 output
15	MIDI IN O	MIDI input output

Speech Control Panel: Voices Not Showing Up (2/97)

Revised: 2/26/97
Security: Everyone

Speech Control Panel: Voices Not Showing Up (2/97)

=====

Article Created: 26 February 1997

TOPIC -----

I downloaded Victoria High Quality and Victoria Small voices from the web, unstuffed the files, put them in the Voice Folder in the Extensions Folder, and restarted my computer. The Speech control panel Voice Menu does not list these two files, yet they are in the correct location. I'm using a Power Macintosh 9500 with Mac OS 7.6 and Speech 1.5. Why is this happening?

DISCUSSION -----

The solution to the Speech voices issue can be understood with some explanation. There are three different types of voices that can be in the Voices folder and three corresponding synthesizers -- each synthesizer works with a different voice type. The three synthesizers, MacinTalk 2, MacinTalk 3, and MacinTalk Pro, all work through the Speech Manager.

For a voice to be supported or active, the corresponding synthesizer needs to be installed in the Extensions folder for that voice type. The voices available at the Web site, Agnes, Bruce and Victoria, are MacinTalk Pro voices and require the MacinTalk Pro synthesizer to be present. The icons of the speech synthesizers and matching voices have a small character (2, 3, or P) in the lower right corner of the icon to designate their type. This supplies a visual aid in identifying the matching voice and synthesizer types. If the voice file has a generic document icon, then the corresponding synthesizer is not present on the disk.

You can run the Mac OS 7.6 installer and custom install just the MacinTalk Pro synthesizer from the English Text-to-Speech 1.5 install package. The base Mac OS 7.6 installation does not add MacinTalk Pro voices, but the Text-to-Speech installer will when appropriate. You can do this by either running the top level "Install Mac OS" application, and choosing customize for just the English Text-to-Speech package, or by opening the English Text-to-Speech folder of the Software Installers folder and running just that one installer.

..TIL21024-Speech_Control_Panel-Voices_Not_Showing_Up_2-97_(TA36542).pdf

PowerBook 3400: Why The Volume Control Button May Not

Revised: 2/28/97
Security: Everyone

PowerBook 3400: Why The Volume Control Button May Not Work(2/97)

=====

Article Created: 26 February 1997
Article Reviewed/Updated: 28 February 1997

TOPIC -----

I have noticed that when I am running some programs (for example; Dark Forces, Hexen and Abuse), that the hardware volume control (the button above the keyboard) does not affect the sound. However, when quitting the game, the new volume is set.

DISCUSSION -----

This is an issue with these specific applications, not with the PowerBook computer or the operating system. Owners of Macintosh Performa and other desktop Macintosh and Power Macintosh computers have had to deal with these types of issues for a while.

The volume control problem is caused by applications that do not allow background processing. This situation occurs more often with games because the processor speed they require to run properly.

Pressing the volume buttons actually generates events that the system processes. Since the game does not allow background processes to run, the events are either not processed or remain in the queue until you quit the game.

The only choice you have is to change the volume through some other means. Sometimes the game applications have volume control as one of their options.

QuickTime MPEG Extension: Read Me Document (2/97)

Revised: 2/26/97
Security: Everyone

QuickTime MPEG Extension: Read Me Document (2/97)

=====

Article Created: 26 February 1997

TOPIC -----

This article contains the ReadMe document included with the QuickTime MPEG extension.

DISCUSSION -----

Introduction

=====

The QuickTime MPEG extension works directly with QuickTime to provide complete playback and control of MPEG movies. After you've installed the extension, each time you open an MPEG movie, QuickTime automatically imports the content of the MPEG movie into a QuickTime movie as a single MPEG track. The MPEG track contains the video and audio streams of the MPEG movie.

Note:

The QuickTime MPEG extension does not contain a compressor component. You cannot use the QuickTime MPEG extension to compress a QuickTime movie to an MPEG file.

System Requirements

=====

To install and use the QuickTime MPEG extension, you must have the following:

- A Power Macintosh computer
- QuickTime 2.5 or later (available at <http://quicktime.apple.com/sw/>)
- Approximately 2.5 megabytes (MB) of free memory per MPEG bitstream (for optimal playback)

Installing the Software

=====

The QuickTime MPEG Installer places the QuickTime MPEG extension in your System Folder. It also installs the MoviePlayer application in a new QuickTime folder on your local hard disk. The MoviePlayer application can be used to play QuickTime content as well as MPEG files. The Installer also installs Thread Manager 2.1.5. This version of the Thread Manager is required to use the QuickTime MPEG Extension.

To install the software, follow these steps:

1. Double-click the Installer icon to open it.
2. Read the message that appears, then click Continue.
3. In the window that appears, read the software license agreement, then click Agree.
4. In the dialog box that appears, make sure Easy Install is selected in the pop-up menu. Then click Install.

Note that by installing the software, you accept the terms of the license agreement.

5. When the installation is complete, click Restart.

Using the Software

=====

- Playback performance depends on your model of computer. A Power Macintosh 7100/80Mhz/601 gets approximately 10-12 fps at a window size of 320 x 240, while a Power Macintosh 8500/120MHz/604 gets approximately 24 fps at a window size of 320 x 240.

- For best performance, make sure your sound is set to 44.1 kHz, 16-bit stereo and your video monitor is set to 256 or thousands of colors. Turn virtual memory and RAM Doubler off.

- Some MPEG files are encoded at 15 or at 7.5 fps instead of the normal 30. If your file appears to be playing much too fast, rename the file ".m15" and/or ".m75" and see if either of those speeds looks correct. For example, rename the file "movie.mpg" to "movie.m15" or "movie.m75."

- After you've installed the QuickTime MPEG extension, you can use the QuickTime Plug-In v1.1 (available at <http://quicktime.apple.com/sw/>) to play back MPEG movies within your Web browser application (such as Netscape Navigator).

- Blacklining is intentional. With large window sizes, blacklining saves CPU cycles. If you want to turn blacklining off, enable High Quality mode. While you're playing a movie in MoviePlayer, choose Get Info from the Movie menu. Choose the MPEG track from the left pop-up menu. Choose High Quality from the right pop-up menu and close the Info window. Blacklining should now be turned off.

- The QuickTime MPEG extension only supports layer II audio streams.

- To play a .DAT file from a CDi or a Video CD, you must open the file from within MoviePlayer by choosing Open from the File menu. Dragging and dropping the file onto your hard drive or onto the MoviePlayer icon will result in an error. Double-clicking the file will also result in an error.
- If you have a MPEG hardware decoder card you must remove the QuickTime MPEG Extension from your Extensions folder to use your card. The QuickTime MPEG Extension will disable your card while it is in your Extensions folder.
- You can find the latest versions of the QuickTime MPEG extension and other QuickTime software at the QuickTime (WWW) Software site, located at the following address: <http://quicktime.apple.com/sw/>

Known Problems

=====

- Non-Apple CD drivers may have problems reading CDi and Video CD discs. We are working with third-party CD-ROM vendors to solve this problem.
- CDi and Video CDs with dual audio tracks encoded in the separate stereo channels may play one track out of each speaker. We are working to fix this problem in a future release. Please use the MoviePlayer Get Info (Command-I) option to access the MPEG track. Choose Volume, and adjust the pan control all the way to the left or the right.
- ClarisWorks' Text Preview extension (installed by ClarisWorks 3.0 and 4.0) interferes with the MPEG file preview. When you open an MPEG file, the Open dialog box displays text symbols rather than a movie clip in the preview window.
- Use Save As, not Save, when you are saving changes to a raw MPEG bitstream from MoviePlayer. Using Save results in an error message.
- Apple Video Player does not play the sound in an MPEG movie (sound only or video-and-sound).
- The MPEG version of Return To Zork does not play properly with the QuickTime MPEG extension. This title's MPEG movies are tuned to specifics of a hardware decompressor.
- The Performa 6205CD may hang when playing long (CDi or Video CD) movies. We are working to solve this problem.
- Some third-party audio boards interfere with synchronization. If you are having synchronization problems and have your sound output from a device other than the internal sound out, try changing to the internal sound device.
- Video CDs with audio tracks are encoded in such a way that the Audio CD Access extension prevents you from seeing the MPEG movies. Remove the Audio CD Access extension, restart your computer, and you should be able to see the MPEG movies on such a disc.

Apple QuickTake 200: Read Me Document (2/97)

Revised: 2/26/97
Security: Everyone

Apple QuickTake 200: Read Me Document (2/97)

=====

Article Created: 26 February 1997

TOPIC -----

This article contains the QuickTake 200 Software ReadME document.

DISCUSSION -----

About the QuickTake 200 Software

=====

This file includes important information about using your QuickTake 200 camera and the Camera Access software. Because this information is not included in the documentation accompanying the product, you may want to print it. To do so, choose Print from the File menu.

Installing the Software

=====

Install the Apple QuickTake 200 software before installing PictureWorks NetCard, Adobe PhotoDeluxe, or Adobe PageMill.

Using Video-in

=====

- Your computer must be compatible with Apple Video Player to use the Camera Access Video-in function. Some CPUs require specific settings. Check your computer user's manual.
- If you have a hardware play-thru video system (for example, Power Macintosh 6100AV, 7100AV, or 8100AV or Macintosh LC 630), video play-thru cannot be turned off via "Video Playthru Off During Record" in the Video-In menu.

Recording a Movie or Video

=====

- When recording with compression, you might need to hold down the mouse button longer to stop the recording process. (In most instances, a click will stop the process.)
- Sound is not supported.

Editing Movie Files

=====

When copying and pasting a movie frame into another movie within the Camera Access software, do not resize the source movie frame. (Resizing will distort the images.)

PowerBook 500 Series

=====

- Set the PowerBook Setup in the Control Panel to Compatible and then launch Camera Access.
- Don't use the Sleep command or close the PowerBook cover while the camera is connected to the Powerbook. This will cause your system to freeze.

Using the QuickTake Plug-ins

=====

- To use the Apple QuickTake 200 plug-in with PhotoDeluxe, drag a copy of the plug-in from the Goodies folder to the Plug-ins folder of the PhotoDeluxe application.
- The QuickTake 200 plug-in is compatible with Photoshop 3.0 and later; it is not compatible with PhotoFlash.
- You can open only one thumbnail at a time. (Even when multiple thumbnails are selected, only the first one will open.)

Closing the QuickTake 200 Panel

=====

When your camera is not connected to your computer, close the QuickTake 200 panel. Leaving it open will slow down your mouse response.

Creating Floppy Disks From the CD-ROM

=====

1. Open the "QuickTake 200 disk image" folder.

2. Click the Disk Copy icon.
3. Click the "Make a Floppy" button.
4. Select QuickTake 200 Software.image.

A message appears: "Please insert a floppy disk." The disk is erased and reformatted, and the QuickTake software is copied onto the disk. A second message appears: "Build floppy operation completed successfully."

5. Click Quit.

Your floppy disk can now be used to install the software.

IMPORTANT:

Don't drag the file onto the Disk Copy icon. You must follow the above procedure.

AppleTalk =====

It is recommended that you turn off AppleTalk when using a 68K CPU (Non-Power Macintosh computer). (Open the Chooser and turn off AppleTalk.)

Using Open Transport =====

It is recommended that you use the Modem port for Camera connection when configuring the port using OpenTransport.

Performa 6420 AV =====

When using Avid Cinema Extension, you should set the Monitor control panel to 32,000 colors (16 bits). Turn off the Avid Cinema Extension when you set to 256 colors.

Printing and Downloading Camera Images Simultaneously =====

There is a conflict in communication when trying to print and open an image from the camera at the same time in a 68K machine. If this problem occurs, please wait until printing is complete, then try opening the image again.

TIFF File Format

=====

Camera Access does not support compressed TIFF files.

Power-Off Problem

=====

On extremely rare occasions, the QuickTake 200 camera might not power off. If this happens, disconnect the camera from the optional AC power adapter. Open the battery door to reset the camera.

Technical Support for Adobe PhotoDeluxe and Adobe PageMill

=====

- For Adobe PhotoDeluxe support, call 206-628-5726.
- For Adobe PageMill support, call 206-628-5731.

Apple VideoPhone: Read Me (2/97)

Revised: 2/26/97
Security: Everyone

Apple VideoPhone: Read Me (2/97)

=====

Article Created: 26 February 1997

TOPIC -----

This article contains the ReadMe file for Apple VideoPhone.

DISCUSSION -----

About Apple VideoPhone 1.5.1

=====

Apple VideoPhone is a new program for Power Macintosh computers that allows you to audio conference with any CoolTalk user on the Internet, whether they are using a Power Macintosh computer, or other platforms supported by Netscape CoolTalk. Apple VideoPhone takes advantage of Apple's QuickTime Conferencing technology and the built-in sound capabilities of Power Macintosh computers.

Apple VideoPhone also allows you to conference using live video in addition to audio with other Power Macintosh computers using the MovieTalk protocol. In this mode you can also conference with multiple parties.

Farallon Timbuktu Pro is a program that can be used with Apple VideoPhone to allow users to share applications in real time while conferencing.

For updates or more information about Apple VideoPhone and QuickTime Conferencing, check out our web site at: <http://qtc.quicktime.apple.com/>

Hardware Requirements

=====

- * Power Macintosh computer
- * 16 megabytes of RAM
- * PlainTalk microphone
- * Access to a TCP/IP based network
- * A video source such as the QuickTime Conferencing Camera 100 (optional)
- * External speakers (optional)

Note: If using Apple VideoPhone in conjunction with Netscape Navigator 3.0 or

later, it is recommended that you have at least 24 megabytes of RAM.

Software Requirements

=====

- * System 7.5.3 or later (System 7.5.5 strongly recommended)
- * QuickTime 2.5
- * OpenTransport 1.1.1 or later

Installation Tips

=====

The Apple VideoPhone installer checks for the correct versions of System Software, QuickTime and OpenTransport before it allows installation of Apple VideoPhone. All the required software can be downloaded from the Internet at the following locations:

Apple's software update web site: start at <http://info.apple.com/swupdates/> and log on to one of the FTP sites.

America Online: use the keyword applecomputer

CompuServe: on the GO APLSUP forum

Important Information About Version 1.5.1 of Apple VideoPhone

=====

* You will see warnings if you are trying to install Apple VideoPhone 1.5.1 on a computer that already has a 1.0.x, 1.1 or 1.4 version of QuickTime Conferencing installed. Apple VideoPhone 1.5.1 is not designed to support the QuickTime Conferencing H.320/ISDN Card. If you still wish to install Apple VideoPhone on a computer with the QuickTime Conferencing H.320/ISDN Card installed, you must remove the "QTCSound" file from the Extensions folder inside your System Folder before proceeding with the install. Previous versions of Apple Media Conference or Connectix VideoPhone may not function optimally after installing Apple VideoPhone 1.5.1.

* You may experience a problem with some Internet Service Providers (ISP) where your modem connection is periodically dropped. The symptoms of this are that audio and video stops updating, but the application does not close. If this occurs, it is best to quit Apple VideoPhone, disconnect from the ISP, reset your modem, reset your PPP connection, and then relaunch Apple VideoPhone.

* You may notice that Apple VideoPhone automatically redials your ISP a few minutes after the ISP has dropped your modem connection. This is normal if you have configured your Apple VideoPhone preferences to register you on a 411 Directory Server. Apple VideoPhone periodically tries to contact the server, and will try to re-establish the ISP connection if it was closed while the Apple VideoPhone was launched. Unfortunately, you will not be able to make or receive calls once an ISP connection has dropped until you have followed the steps in the paragraph above. To avoid unattended ISP connections, it is best to quit the Apple VideoPhone application before disconnecting from an ISP.

* Using CoolTalk with the RT24 audio compressor is not recommended between two machines connected via ethernet unless they have a router between them. In some cases, users may experience problems resulting from heavy usage in this configuration. Connecting via Internet link (either modem or direct connection) is not a problem.

* Apple VideoPhone is designed to work with MacPPP 2.5.1. Users of other versions of PPP, including MacPPP 2.5 (included with OpenTransport 1.1.1 in the Extras Folder), FreePPP and OT-PPP may experience problems unless they make sure that MacPPP 2.5.1 is selected in the TCP/IP Control Panel before dialing an ISP to use Apple VideoPhone.

Special Information for Power Macintosh 7300, 7600, 8600 and 9600 computers

Apple VideoPhone Lite 1.5.1 installs compression software and extensions that are specifically for video conferencing. If you wish to use other applications that capture video (such as Adobe Premiere or Avid Cinema) use an extension manager to temporarily disable the extensions or follow the instructions below:

- 1) Open the Extensions Folder within your System Folder.
- 2) Select the following files:

- Apple GSM Codec 1.0
- H.261 1.0.4 PowerMac
- H.263 1.0.3 PowerMac
- QTCCoMpoNentDV 2.0

3) Drag them out of the Extension folder and save in a folder outside of the System Folder.

4) Restart.

5) You are now ready to capture video in another application.

6) To use Apple VideoPhone again, place these extensions back into the Extensions folder and restart your computer.

Setup

=====

The Apple VideoPhone installer creates a new folder on your hard drive called "Apple VideoPhone." Look inside this folder for the Apple VideoPhone application icon.

* If using externally powered speakers, it is recommended that you use RCA-style connectors to connect to the left and right audio (the ones marked CD) on the back of the speakers, not to the Audio-in port (the stereo miniplug marked with the Mac icon). This will avoid a problem where low-level audio is cut off.

* The preferences file is now located in the Preferences folder inside the System Folder, in a folder called "Apple VideoPhone." If you have installed over a previous version of Apple VideoPhone, consider copying your old preferences file out of the application folder into this new folder. Most of your preferences will be retained if you do this.

* Connectix Color QuickCam users may experience problems when taking snapshots. Download the "Color QuickCam 2.1a Updater" from the Connectix web site at <http://www.connectix.com/>.

* Apple VideoPhone is not intended for use on a computer running router software.

Launching

=====

* Do not try to launch this version of Apple VideoPhone with less than 3.5 megabytes of available RAM.

* If you wish to transmit a picture of yourself, copy a snapshot into a graphics editor and save it as a PICT file.

* If your preferences are configured to connect to a 411 Directory Server which is unavailable because you don't have access, the server is not running or the server already has the maximum number of connected users, you may receive an error -7974 on launch. If this happens, try launching again. To select another server, it is best to select the server in the preferences dialog, quit the application and relaunch. The 411 Directory Server at live.netscape.com is often busy.

Note: If your ISP assigns a different IP address every time you connect (dynamic addressing) you will need to notify parties of your current IP address before they can call you. Your IP address appears in your TCP/IP Control Panel. In some cases, the address may not update until you actually use an IP service, such as trying to place a CoolTalk call. The 411 Directory Server tries to alleviate the limitations of dynamic addressing. If available, static addressing is preferable.

* Apple VideoPhone checks for an available TCP/IP network. Before you launch Apple VideoPhone, you must configure and activate your TCP/IP Control Panel. If you have a direct Internet connection consult with your network administrator to make sure you have the correct IP address, subnet mask and domain name service information. If you are using a modem or ISDN terminal device, configure your TCP/IP to dial your Internet access account via PPP. Apple VideoPhone will initiate the call on launch if PPP is configured correctly.

* Before you launch Apple VideoPhone, it is recommended that you turn off Virtual Memory (VM) in the Memory Control Panel. VM is NOT recommended for use with any QuickTime application using real time video. On certain Macintosh computers you will not be able to send video unless you turn off virtual memory.

* You may notice that application memory isn't being released promptly after you quit Apple VideoPhone. If this is a problem uncheck the "Load only when needed" checkbox in the options dialog in the TCP/IP Control Panel.

Connecting

=====

* You must allow enough time for a complete disconnection before you try to connect again. Apple VideoPhone currently requires several seconds to completely disconnect from a conference. If you try to connect (or someone tries to connect to you) before you have completely disconnected, you may experience problems. It is best to wait at least 10 seconds between connections.

* Multiparty conferences and maximum sized (2X) video windows require more memory to function well. If you plan to use these features, increase the Memory Requirements Preferred size by at least 1000k per additional party and relaunch

the Apple VideoPhone. To edit Memory Requirements do the following:

- quit Apple VideoPhone (if launched)
- go to the Finder
- select the Apple VideoPhone icon by clicking on it once
- select "Get Info" in the "File" menu
- increase the value in the "Preferred size" box by the required amount
- close the Get Info window
- launch Apple VideoPhone

* You may experience problems calling a person to whom you are already connected.

* Auto answer doesn't work with Apple VideoPhone in the background and Movie Player running in Presentation mode.

* It is possible to access Netscape's 411 Directory Server from a web page. The URL is <http://live.netscape.com/>. The first time you use it, you will be asked by Navigator to pick an application to launch. Be sure to select Apple VideoPhone. You will experience difficulty if you select the Conferencing Helper Application included with Apple VideoPhone. For more information about the proper use of the Conferencing Helper Application, see "Using Conferencing Helper Application" section later in this document.

Audio

=====

* If you are using CoolTalk settings to audio conference, and you see a dialog box notifying you that you don't have the correct type of audio compressors, you can download the audio compressor from Netscape's FTP site at:

<ftp://ftp.netscape.com/pub/cooltalk/mac/netscapeGSMCodecInstaller.hqx>

* When conferencing with a CoolTalk user on a PC, you may find that you cannot hear audio sent by the PC. Some PC sound cards do not support full-duplex sound. Try clicking on the "Hold" button on the Mac side when you want to hear audio from the PC. This will temporarily block the Mac from sending sound. You will have to deselect "Hold" on the Mac when you want to talk. You can also try adjusting the silence sensor in the sound level meter. Asymmetric connections, where one computer is connected to a relatively fast network and the other computer is using a 28.8 modem connection may experience the same problem.

* Full-duplex audio is not supported on the Performa 6320. You will not be able to talk and listen at the same time.

Video

=====

* When using the H.263 video compressor, you will not be able to resize your self-view window to the largest (2X) size.

* Apple VideoPhone does not run well on multiple monitor configurations. For best results, arrange all Apple VideoPhone video windows on the monitor that is connected to the AV subsystem of your computer.

* Apple VideoPhone may not run properly in videoconferencing mode if launched when Apple Video Player is already running, or if the 1.0 extensions for the Avid Cinema Card are enabled. Quitting Apple Video Player and/or temporarily disabling the Avid Cinema extensions will enhance the video performance of Apple VideoPhone.

Collaboration

=====

* Video windows within the Timbuktu Pro window will not update unless you select the Timbuktu Pro preference to bypass QuickDraw, however, this will increase network traffic and may have an undesirable effect on video quality.

* Some applications will run very slowly over a Timbuktu Pro connection.

Using Conferencing Helper Application

=====

The Apple VideoPhone installer places the Conferencing Helper Application inside a folder called "Extras" in the Apple VideoPhone folder. The Conferencing Helper Application can be used to enable Apple VideoPhone to be launched as a helper application from a web page. Netscape Navigator 2.0 or later is pre-configured to recognize the QuickTime Conferencing mime type. For instructions on how to configure other web browsers, consult the instructions on the QuickTime Conferencing Home Page. Additionally, it is recommended that you configure the Macintosh Easy Open control panel by disabling "Always show dialog box" and enabling "Auto pick if only one choice."

The QuickTime Conferencing Home Page

=====

To find out about the latest QuickTime Conferencing software updates, information, announcements, live broadcast events, questions, answers, and related products, point your web browser at:

<http://qtc.quicktime.apple.com/>

QuickTime Conferencing and Firewalls

=====

At those sites with Internet firewalls such as corporations, universities or other large institutions it may be necessary to configure the firewall so that QuickTime Conferencing applications can use certain features. This is typically not a problem for Internet Service Providers. Contact your network administrator to send the following information.

* To allow MovieTalk calls to be sent and received at an Internet site, allow outgoing and incoming TCP traffic on port 458.

* To allow MovieTalk media streams to flow outwards through the firewall, allow outgoing UDP traffic with static port 458 and with dynamic port values greater than or equal to 7000.

* To allow MovieTalk media streams to flow in through the firewall, allow incoming UDP traffic with static port 458 and with dynamic port values greater than or equal to 7000.

* To allow CoolTalk to access the 411 Directory Services, allow incoming TCP traffic on port 6499.

* To allow CoolTalk calls to be sent and received at an Internet site, permit outgoing and incoming TCP traffic on port 6500.

* To allow CoolTalk audio streams to flow in through the firewall, allow incoming UDP traffic with a static port of 13000.

Clr StyleWriter 2400, 2500: Vertical Lines Appear Jagged (2/97)

Revised: 2/27/97
Security: Everyone

Clr StyleWriter 2400, 2500: Vertical Lines Appear Jagged (2/97)

=====

Article Created: 27 February 1997

TOPIC -----

When using the High Performance Black Ink cartridge, my Color StyleWriter 2500 (or Color StyleWriter 2400) printer produces jagged vertical lines. However, printing from the color cartridge looks fine. How can I eliminate this?

DISCUSSION -----

The design of the High Performance Black Ink cartridge with its many ink nozzles lets it rapidly print several pages per minute. If the cartridge does not mount so that the ink nozzles are perpendicular to the leading edge of the paper, then jagged lines can result. In order to maintain optimal print quality when using the High Performance Black Ink cartridge, it must be perfectly seated in the printer. Insert the high performance black cartridge in the printer and then move the blue cartridge locking lever up and down several times. DO NOT touch the printhead cartridge when performing this action or the cartridge will not remain properly aligned. This procedure has been very successful in minimizing jagged lines and is recommended for all customers when installing ink cartridges.

If the results are still not acceptable, it may be necessary to use one of the workarounds below which have been successful during testing.

1) Print using the Glossy paper mode which is available in the print dialog box under the 'paper type' settings. This mode will change the way the ink is laid down on the paper and as a result minimize the jagged vertical lines.

2) Print using the color ink cartridge. This helps eliminate the jaggedness because the number of ink nozzles that print black ink in one pass is significantly reduced. The frequency of the jagged lines increases, but their length decreases, making the lines appear nearly straight.

GeoPort & Express Modem Updater 3.1.1 Read Me (2/97)

Revised: 2/27/97
Security: Everyone

GeoPort & Express Modem Updater 3.1.1 Read Me (2/97)

=====

Article Created: 27 February 1997

TOPIC -----

This article is the GeoPort & Express Modem Updater 3.1.1 ReadMe file.

DISCUSSION -----

Your package includes a software updater for use with the following configurations:

GeoPort Telecom Adapter and one of the following Macintosh models:

- Performa 6360 and all PowerPC processor-based Macintosh and Performa models, except Power Macintosh and Performa 5200, 5300, 6200, 6300 series

GeoPort Telecom Adapter II and one of the following Macintosh models:

- Performa 6360 and all PowerPC processor-based Macintosh and Performa models, except Power Macintosh and Performa 5200, 5300, 6200, 6300 series

GeoPort Internal Modem and one of the following computers:

- Performa 5400 series, 6400 series, and 6360

IMPORTANT:

To use the GeoPort Telecom Adapter II in the United States, Canada, or Japan, version 3.1 or later of Apple Telecom Software is required. To use the GeoPort Telecom Adapter II in all other countries or GeoPort Internal Modem in all countries, version 3.0 or later of Apple Telecom is required. To use the original GeoPort Telecom Adapter with the Power Macintosh 7200 series, 7500 series, 7600 series, 8500 series, and 9500 series, version 3.0 or later of Apple Telecom Software is recommended.

Apple PowerBook Duo 14.4 Modem (internal) and one of the following Macintosh models:

- PowerBook Duo 2300c

Apple PowerBook Express Modem II Card (internal) and one of the following Macintosh models:

- PowerBook 520, 520c, 540, 540c (with a PowerPC processor upgrade)

Note: Some models are not available in all geographic areas.

For the remainder of this document, the term GeoPort Telecom Adapter refers to all GeoPort products: GeoPort Telecom Adapter, GeoPort Telecom Adapter II, and GeoPort Internal Modem.

What this update provides

For Power Macintosh users with GeoPort Telecom Adapter

This update provides support for V.34 protocols, which allow data transfer at speeds up to 33.6 Kbps. Depending on line conditions and the capabilities of the remote modem, your connection speeds may be lower. Common data transfer speeds will be between 16.8 Kbps and 24 Kbps, although they may be higher or lower.

For Express Modem users

This update provides software improvements, but does not provide any speed increase to the Express Modem. For System 7.5.5 users, it is recommended that you install this update.

LocalTalk compatibility with GeoPort Telecom Adapter

If you are using a GeoPort Telecom Adapter on a Power Macintosh 7200 series, 7500 series, 7600 series, 8200 series, 8500 series, or 9500 series, you must disable LocalTalk. To do this, disconnect any LocalTalk devices attached to the printer port (serial devices can remain attached).

Sleep (Power Macintosh and Performa models)

Some Macintosh desktop models, including Power Macintosh 7200 series, 7500 series, 7600 series, 8200 series, 8500 series, or 9500 series, Power Macintosh and Performa 5400 series, 6400 series and Performa 6360, support the Sleep feature to conserve energy. If you select "Sleep" from the Special Menu available on these models while there is an active GeoPort connection, the GeoPort Telecom Adapter will disconnect the call without warning.

Connection (CCL) scripts for Apple Remote Access

Use the following connection script with Apple Remote Access:

GeoPort/Express Modem

This file is installed in both the Extensions folder inside the System Folder and in the Modem Scripts folder inside the Extensions folder. It is installed in

two places to support all versions of Apple Remote Access.

An additional, optional connection script, named "GeoPort/Express Modem CNG," is installed in the same two places. When you use this optional script, the GeoPort Telecom Adapter or Express Modem transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem call. If you are dialing into a system that supports data, fax and voice calls (such as another GeoPort Telecom Adapter), you should select this connection script in the Apple Remote Access Setup control panel.

Communication settings

If you are using a terminal emulator or communications program that supports the Apple Communications Toolbox, you should select the "Express Modem Tool" from the connection settings menu item. This tool's default settings will always try to establish connections at the highest possible speed with error correction and compression enabled.

Using RAM Doubler

If you are using RAM Doubler from Connectix with Apple Telecom software, you should use RAM Doubler version 1.6.2 or later.

Troubleshooting

Clicking sound from GeoPort Telecom Adapter

If your computer freezes, the GeoPort Telecom Adapter can lose its connection with your computer and may generate a rapid clicking sound. This sound is a temporary side-effect of the lost connection. To stop the clicking, unplug the adapter for a few seconds or restart your computer.

Installing the updater

To install the GeoPort & Express Modem Updater

1. Turn on your computer.

2. Double-click the Installer icon.

An introductory dialog appears.

3. Click Continue.

The Easy Install dialog box appears. Easy Install automatically detects the Macintosh model you are using and installs the software you need.

4. Make sure the hard disk indicated is where you want to install the software. If the wrong disk name appears, click the Switch Disk button until the disk you want appears.

5. Click Install.

A message informs you when the installation is complete. You need to restart your computer in order to use your newly installed software.

6. Click Restart to restart your computer and activate the software.
7. The Installer places a new version of the Express Modem control panel in the Control Panels folder inside the System Folder. Be sure to verify the settings before starting to use your modem software.

What goes where

When you install the software using the Easy Install option of the Installer program, the following files and resources relating to the GeoPort Telecom Adapter or Express Modem are installed on your hard disk.

Hard Disk:

- GeoPort/Express Modem Read Me

Hard Disk: System Folder: Control Panels:

- Express Modem

Hard Disk: System Folder: Extensions:

- AudioTuneUp (GeoPort/Power Macintosh 9500 series with System 7.5.2 only)
- Apple Telecom Modem
- Express Modem Tool
- GeoPort for Power Macintosh (GeoPort configurations only)
- GeoPort Serial Driver (GeoPort configurations only)
- GeoPort Telecom Adapter (GeoPort configurations only)
- GeoPort Telephone Tool (GeoPort configurations only)
- GeoPort/Express Modem (Apple Remote Access CCL script)
- GeoPort/Express Modem CNG (optional Apple Remote Access CCL script, with calling tone)
- Serial Extension (GeoPort and 6100/7100/8100 series only)
- Serial (Built-in) version 1.2.2 (GeoPort/5400/6400 series and 6360 only)
- Shared Library Manager (GeoPort configurations only)
- Shared Library Manager PPC (GeoPort configurations only)
- Telephone Manager Extension (GeoPort configurations only)

Hard Disk: System Folder: Extensions: Modem Scripts

- GeoPort/Express Modem (Apple Remote Access CCL script)
- GeoPort/Express Modem CNG (optional Apple Remote Access CCL script, with calling tone)

Hard Disk: System Folder: System:

- Bell Telephone (sound resource)
- Electronic Telephone (sound resource)

AppleTalk Router: Differences, Seed & Non-Seed Ports (2/97)

Revised: 2/27/97
Security: Everyone

AppleTalk Router: Differences, Seed & Non-Seed Ports (2/97)

=====

Article Created: 27 February 1997

TOPIC -----

What is the difference between a seed port and a non-seed port on an AppleTalk router?

DISCUSSION -----

In order for routers to perform their role of routing traffic to its intended destination, they must know the identity of each network segment on the network. In the case of a LocalTalk segment, this identity is established by a network number. In the case of EtherTalk or TokenTalk segments, the identity is established by a range of contiguous network numbers known as a network range. For each network segment on an AppleTalk network, at least one router must supply the network number or range that uniquely identifies the segment.

Zone names are also linked to network segments, but do not have to be unique. This allows network segments at different locations to encompass logical groups of users. For instance, a zone named "Sales Support" could span several floors in a building with a number of network segments joined by routers.

A seed port is defined as a router port configured with a network number or network range and a zone name or zone list that identifies the network segment it is attached to. Every network segment on an extended network will have at least one router seed port active to supply its identity. A network segment may have more than one router supplying seed information, but if this is the case, each of these must absolutely agree on the information being supplied or chaos will result. Some, but not all, routers will generate alerts on startup if they detect conflicting seed information on a network segment.

A non-seed port is defined as a router port configured to obtain the network number or network range and a zone name or zone list, that identifies the network segment it is attached to from a seed router port attached to the same network segment. When a non-seed port is activated, it queries the network segment for configuration information which gets supplied in the form of a reply

from a seed router on the same segment.

Apple Internet Router and TCP/IP (2/97)

Revised: 2/27/97
Security: Everyone

Apple Internet Router and TCP/IP (2/97)

=====

Article Created: 27 February 1997

TOPIC -----

Will the Apple Internet Router route TCP/IP between network segments? What about the IP Wide Area Extension?

DISCUSSION -----

The Apple Internet Router is an AppleTalk-only router. It will not route any other protocol, including TCP/IP.

The Apple Internet Router AppleTalk/IP Wide Area Extension provides a method for tunnelling AppleTalk traffic between two AppleTalk routers across a TCP/IP-only backbone network segment. This is accomplished by encapsulating AppleTalk packets inside of TCP/IP packets. The IP Wide Area Extension does not route TCP/IP, it rather provides a way to join AppleTalk LANs using a TCP/IP wide area link.

Network Assist: Not Authorized to Launch Message (2/97)

Revised: 2/27/97
Security: Everyone

Network Assist: Not Authorized to Launch Message (2/97)

=====

Article Created: 27 February 1997

TOPIC -----

When I try to launch Network Assistant, I get the following At Ease message:
"You aren't authorized to use this application. Contact your At Ease Administrator for more information." What is wrong?

DISCUSSION -----

This can happen if the specific workstation also has Network Assistant installed. In this case, if the user logs into At Ease as a regular user or as a Workgroup Administrator without explicit Network Assistant privileges (the default is to deny these), they will get this message.

This is a security feature of At Ease. The user will need to log back into At Ease as an At Ease Administrator or Workgroup Administrator (If Network Assistant privileges have been added). If they are neither an Administrator nor a Workgroup Administrator with Network Assistant privileges, they should contact their Network Administrator to get their privileges edited. This is done by opening the <user name> from within At Ease Administration, selecting "Privileges", and selecting Network Assistant privileges.

IMPORTANT: A user will be able to launch At Ease Administration, Network Assistant Security, or User and Group Manager without getting this message.

QuickTime for Windows: Troubleshooting Tips (2/97)

Revised: 2/27/97
Security: Everyone

QuickTime for Windows: Troubleshooting Tips (2/97)

=====

Article Created: 27 February 1997

TOPIC -----

This article contains error messages and problems related to installation and how to resolve them. This information is extracted from Apple's Developer Technote 1074.

DISCUSSION -----

Troubleshooting QuickTime For Windows

=====

For most installation problems you should first check the QTW version that is installed. If it is a version earlier than 2.1.2, you should try upgrading first. This resolves a lot of installation problems. The interactive way to determine the installed version of QuickTime for Windows is to run Movie Player (player.exe in the Windows directory) and click on Help -- About Movie Player.

The current version of QuickTime is available from the QuickTime web site at www.quicktime.apple.com or from the online Apple Software updates at <http://info.apple.com/swupdates>.

Errors During Installation

=====

- If the installer reports an error indicating that it can't write to a file or that the file is being shared by another application, reboot the system. You may want to try bypassing the startup documents by holding down the shift key or by starting in Windows 95 "safe mode".
- If the installer reports an error during the "modifying .INI files" stage, the problem is that your WIN.INI file is too big. The QTW installer calls Windows' SetProfileString(), which fails if Win.ini is larger than 32KB. This is most commonly caused by the file becoming clogged with hundreds of lines of

PostScript font declarations or something similar.

The workaround is to rename WIN.INI to something else, then install QuickTime for Windows. This creates a new WIN.INI that has just a few lines in it. You can then use a text editor to move those lines to the appropriate sections near the beginning of the big .INI file. Delete the small WIN.INI and rename the big file back to WIN.INI.

- A corrupted directory could cause installation problems. Run the Scandisk utility included with DOS and Windows 95. Windows 3.x users must exit to DOS to run Scandisk.

An Error During Re-Install

=====

Sometimes when you do a re-install using the "Reinstall QuickTime" icon you may receive an error message saying that the QTINSTAL.EXE file is missing. If you look for this file, you will find that it really is missing! Because this is your executable installer file, you need to re-install from the original installation location (CD-ROM, network server, diskette, etc.)

Fixing Audio Break-up Problems

=====

Some audio cards and drivers use a large amount of CPU time. This can cause break-up of the audio accompanied by poor video performance. The original SoundBlaster Pro, for example, has problems when the total audio data rate exceeds 22050 bytes per second. To improve performance, the audio data rate can be limited by the use of several settings in the QTW Control Panel's More|Audio screen. Here are two ways to limit the rate to 22050:

Step 1

For mono audio at 22050 bytes per second, set:

Sample Rate Requested hz: 22050

Sample Depth: 8 bit

Channels: Mono

OR

Step 2

For stereo audio at 22050 bytes per second, set:

Sample Rate Requested hz: 11025

Sample Depth: 8 bit

Channels: Stereo

NOTE:

Automatic Rate Adjustment should only be selected if your only performance problem is the audio slowly drifting out of synch with the video. To save these settings, click Close, and restart Windows before retesting performance.

Audio-Video Synchronization Problems

=====

QTW 2.1.2 contains an automatic-audio-rate-adjustment feature which was meant to correct audio playback problems on systems that contain an ESS sound chip. While this goal is usually achieved, on some systems undesirable side-effects such as high-pitched sound may occur.

The solution to this problem (when it occurs) is as follows:

- 1) Go to the QuickTime Control Panel and select More--Audio.
- 2) Change the Sample Rate-Requested hz: to "default".
- 3) Make sure that Automatic Rate Adjustment is selected.
- 4) Click Close, and then restart Windows (to be on the safe side).
- 5) Play the calibration movie, SAMPLE.MOV, from the Windows directory.
This recalibrates the sound chip.
- 6) Exit Movie Player and go back to the QuickTime Control Panel.
- 7) Select More|Audio and deselect Automatic Rate Adjustment.
- 8) Click Apply, and then Close. Sound should now be fine.

Encountering DynaLink Errors

=====

A Dynalink error may occur if, for some reason, there are older versions of QTW files installed. This would only occur in 16-bit QTW.

To resolve this problem, you should first try reinstalling QTW 2.1.2, making sure that you select the Check for Existing Versions option during installation. See the Installation Dialogs section of this Note for more details.

If the problem still occurs, you are probably running an application from a read-only volume, such as a CD-ROM, which has an older version of QTW on it. Your only option at this point is to uninstall QTW 2.1.2 (see the section Un-installing QuickTime for Windows). Then you can install your application from the CD-ROM which will install the required early version of QTW.

Fixing Video Draw Problems

=====

If QuickTime for Windows doesn't recognize or falsely recognizes the display board, or if you simply suspect that your problems are related to drawing the Movie image on the screen, you need to change the Video Draw Method. The recommended way to do this is with the QuickTime Control Panel; however, it can also be done by editing the QTW.INI file.

To do this from the Control Panel, follow these steps:

- 1) Select More--Video--Draw Method from the QuickTime Control Panel.
- 2) Change the Optimization to: Driver.
- 3) Click Close, and restart Windows (to be on the safe side).
- 4) If that doesn't work, try the other Optimizations. They are listed in order

of speed (fastest to slowest), so try the faster ones first.

Editing the QTW.INI file, however, is not recommended. The reason is that it's easy to get it wrong. The only time you might have to do this is if your video is so messed up that you can't even bring up the Control panel without crashing. In that case, you need to edit the QTW.INI file.

To do this by editing the QTW.INI file, add or change the [Video] section of QTW.INI to read:

```
[Video]
Optimize=Driver
```

This is how you fix 16-bit QTW. To fix 32-bit QTW, you change the Section name from [Video] to [Video 32]. If 'Driver' doesn't work, try 'BMP', 'RAW', and 'DIB'.

MPEG and QuickTime for Windows =====

Currently, there are no known MPEG boards that work with QTW. In the past, the REALmagic MPEG boards did work with QTW; the latest REALmagic boards, however, do not. Those users with old REALmagic boards may be able to play MPEG videos through QTW, but only under the following configuration:

- Windows 3.1
- One of the discontinued REALmagic boards: ReelMagic, REALmagic Lite, or REALmagic Rave
- The discontinued REALmagic driver, version 2.01.

Most users will not have this configuration and, therefore, must play MPEG videos using the application or method provided with their MPEG board.

Because there was support for MPEG through QTW in the past, versions of QTW 2.0.0 - 2.1.0 associate .MPG files with the QuickTime Movie Player. This means that when you open a .MPG file, Movie Player will launch and attempt to play the MPEG video. Now that MPEG support for QTW is no longer available, Movie Player will still launch but display a message stating that QuickTime cannot play this video. The problem was fixed in QTW 2.1.1 by removing the .MPG file association.

This file association problem in the earlier versions led some hardware manufacturers to ask their customers not to install QuickTime or applications that install QuickTime. These manufacturers are not aware of the fix. Thus, any users concerned about installing QTW because their computer manufacturer recommends against it should feel safe to install QTW 2.1.2 and applications that install QTW 2.1.1 or later.

Steps to Ensure That an Old Installer Doesn't Associate .MPG Files With QuickTime =====

If you are installing an application that installs a version of QTW earlier than version 2.1.1, you should follow the steps below to ensure that the old installer doesn't associate .MPG files with QuickTime:

- 1) Check the current file association for .MPG files and make a note of it.
- 2) Install QTW 2.1.2.
- 3) Install the application.
- 4) Check the file association for .MPG files again.
- 5) If the file association for .MPG files was not changed, you are done. If it has changed, proceed to step 6.
- 6) Change the .MPG file association back to what it was in step 1 (see your Windows manual or below if you are unsure how to do this).
- 7) Reinstall QTW 2.1.2 since it was overwritten by an older version.

The reason this series of steps works is because when the application's installer attempts to install the older version of QTW in step 3 above, the installer will see that there is already a newer version installed and skip the QTW part of its installation. However, there is a possibility that the application's installer was not written to notice that a newer version of QuickTime was already installed and, as a result, the older version of QTW will be installed. This is what would cause the .MPG file association to be changed in step 4 from what it originally was in step 1. You can then correct the problem by changing the .MPG file association back to what it was and then reinstalling QTW 2.1.2.

Variations in Methods for Changing .MPG File Association

=====

The method for changing the .MPG file association will vary depending of the version of Windows being used. For Windows 3.1, in the File Manager, you need to select Association from the File menu. For Windows 95, you need to open an explorer window and select Options from the View menu. Then, you click on File Type and edit the file association.

NOTE:

If the file association for .MPG files was changed by an earlier installation of QTW, installing QTW 2.1.1 or 2.1.2. will not restore the file association back to what it originally was. Thus, .MPG files will continue to launch QuickTime, even with the new version installed. You need to manually correct the file association using the method described above. If you don't know what the original .MPG file association was, you need to contact your MPEG vendor to get it.

Un-Installing QuickTime for Windows

=====

QuickTime for Windows v2.1.2 has an un-installer that works with Windows 95 and Windows NT. It does not work, however, with Windows 3.1.

There are several reasons why you may want to un-install QTW 2.1.2. For example,

you may want to free up disk space, or you may need to run an application from a CD-ROM that requires an older version of QTW. You should not uninstall QTW to free up memory because, when QTW is not being called, it is not loaded into memory at all and therefore does not use any unnecessary overhead.

If you must uninstall QTW 2.1.2 and you're using Windows 3.1, remove all files in the Windows directory and Windows System directory with the date of 8/27/96 and time stamp of 2:12:00AM. The only file you do not want to delete is the 2.1.2 installer file, so that you can reinstall QTW 2.1.2 in the future. This is the safest way to manually uninstall QTW.

Follow these steps to manually un-install QTW:

- 1) In the File Manager, go to the Windows directory.
- 2) Select View--Sort by date
- 3) Click and select the first file with the date of 8/27/96 and time stamp of 2:12:00AM.
- 4) Shift-Click the last file in the list with the same date and time stamp so that all files with this date and time stamp are highlighted.
- 5) Control-Click on the QTINSTAL.EXE file so that you don't remove the 2.1.2 installer. This file should no longer highlighted after you Control-Click. NOTE: For 32-bit, it's QT32INST.EXE, not QTINSTAL.EXE.
- 6) Delete the highlighted files.
- 7) Repeat steps 1 through 6 for the Windows System directory but skip step 5, since the QTINSTAL.EXE file doesn't exist in this directory.

Security: Everyone

Network Server: Determining Filesystem Usage (2/97)

=====

Article Created: 27 February 1997

TOPIC -----

How can I determine how full filesystems are on an Apple Network Server?

DISCUSSION -----

Typing the following command in an AIX command shell will return the number of blocks, number of blocks free, and percent used in each mounted filesystem.

```
df -k
```

As a general rule of thumb, any filesystem more than 90% full should be expanded to avoid potential problems. A full filesystem can result in a server crash.

QuickTime for Windows: Control Panel Tips (2/97)

Article Created: 28 February 1997

TOPIC -----

This article describes some QuickTime for Windows Control Panel tips.

DISCUSSION -----

The QuickTime Control Panel is useful to verify your setup. You can also use it to customize your installation. The Tech Info Library Article titled "QuickTime for Windows: Troubleshooting Tips" provides examples of when you may want to modify the QuickTime Control Panel.

Here are some QuickTime Control Panel tips.

Tip #1

Click the Verify Setup button from the QuickTime Control Panel.

This either verifies a successful installation with a message No Problems Found, or it displays any missing files designating an unsuccessful installation.

Tip #2

Do not use the Apply button when you've made modifications to the QuickTime Control Panel.

The Apply button writes changes to the QTW.INI file, but will not take effect until after the Control Panel is closed. Therefore, it is better to use the Close button, which asks you if you want to apply your changes if you have, in fact, made changes. When you select Yes, the modifications are actually applied and the Control Panel is closed at the same time.

Tip #3

Restart Windows after making modifications to the QuickTime Control Panel,

especially if you were having problems.

This ensures that changes you made are available when you start the Movie Player.

Article Reviewed/Updated: 18 April 1997

TOPIC -----

I have been having problems with my PowerBook 5300 ADB devices. I have a mouse, keyboard, and an AppleVision 1710AV display connected. Is there a limit to how much power ADB devices should use? I have replaced my PowerBook logic board and I'm not sure if connecting too many ADB devices is causing the problem.

DISCUSSION -----

There should be no way that the ADB +5V line on the PowerBook 5300 can be "blown out" by connecting too many ADB devices. There is protection circuitry that shuts the ADB +5vdc lines off when the load is exceeded. The protection circuitry is reset when the ADB load is removed.

When too many ADB devices are connected and the current load is too high, to protect the PowerBook the ADB power turns off. The connected ADB devices will stop working when this protection circuitry activates and shuts the ADB power off. When this happens, the ADB devices need to be physically disconnected to reactivate the +5vdc ADB line in the PowerBook. Once the devices have been disconnected and after a few minutes, the protection circuitry on the PowerBook 5300 is reset and the ADB +5 volt line reactivated.

If you connect enough devices to exceed the 200ma ADB specification for the PowerBook 5300, you may think there is a problem with the computer. This may seem like the case when the ADB current draw activates the protection circuitry, and the power is turned off since the external devices stop working.

The PowerBook 5300 ADB supply current and keyboard/mouse current requirements are shown in the charts below. The ADB current of other Apple models is available in technical specifications section of the Tech Info Library. You can locate your specific model by searching for specsht and the Macintosh model you own.

Device	ADB current
PowerBook 5300	Can supply 200mA maximum to connected ADB devices.
Apple Desktop Bus Mouse II	80mA
Apple Design Keyboard (M2980)	under 200mA
Apple Extended Keyboard (M3501)	85mA
Apple Keyboard II (M0487)	100mA

The AppleVision 1710 Display draws different amounts of ADB current based on its power or operating status. An AppleVision 1710 Display powers on when the following conditions exist: the AC switch is on, the display is plugged in, and there are active video signals on the video connector. Even when the display is plugged in and the power switch is on, as long as there is no video signal the display is not powered on.

These are typical ADB values for the AppleVision 1710 and AppleVision 1710AV Displays; variation from unit to unit may be 10%.

Display Device	ADB current AC power off	ADB current AC power on
AppleVision 1710	50mA	0mA
AppleVision 1710AV	100mA	1mA

A keyboard and mouse can reliably be attached to a PowerBook 5300 depending on which keyboard is attached. When also attaching an AppleVision 1710 or AppleVision 1710AV display, it is recommended that you only use the Keyboard II or Extended Keyboard. Under circumstances where the total current for the ADB devices exceeds the 200mA specification for the PowerBook 5300, the ADB +5vdc power may shut off. This disables the ADB devices, such as the mouse and keyboard, but it does not permanently harm the PowerBook 5300.

If you have a question about whether devices will work if they are all connected, you can connect them as an experiment to see if they will work. If the devices do not work because the power requirements are greater than the PowerBook 5300 specification, the ADB devices should be disconnected. Only the configuration that has a total load less than 200ma should be used, but the PowerBook 5300 ADB will not get "blown out" by testing a particular

configuration.

When the PowerBook has been activated, taken out of sleep, or powered up, the AppleVision 1710 and AppleVision 1710AV Display will be activated by the video signal from the PowerBook and the display will power up. Once the display image is active, the ADB current draw from the AppleVision Display will drop close to zero. When the display is powered up, the only current draw on the ADB line is that of the other devices attached to the ADB line, such as a mouse or keyboard.

OpenDoc Essentials and TextEditor Object (2/97)

Revised: 2/28/97
Security: Everyone

OpenDoc Essentials and TextEditor Object (2/97)

Article Created: 28 February 1997

TOPIC -----

I installed just the Mac OS 7.6 basics on my computer, which includes OpenDoc and the OpenDoc Essentials; I did not install anything else. When I double-click the AppleDraw Stationary, the "A" button for creating a text area is grayed out. Why?

DISCUSSION -----

The AppleDraw OpenDoc Editor Component is looking for a "Text Editor" Editor Component and can not find one. Therefore you can not create or edit text objects, you can view them only.

Solutions and Workarounds

- Install CyberDog, which will install as part of the CyberDog Editors a text editing editor component, letting you create, edit, and view text objects.
- Visit the OpenDoc Web Site, <<http://opendoc.apple.com/>> and look for a freeware/shareware (F) and commercial (C) text editor components.

The following are examples, and are NOT supported by Apple Telephone Support. This is a partial list, and more are being developed.

(F) BBEdit Lite (OpenDoc)	< http://www.barebones.com/ >
(C) Corda Technologies TextBox	< http://www.corda.com/ >
(C) Digital Harbor WAV	< http://www.dharbor.com/ >
(C) Nisus(r) Writer	< http://www.nisus-soft.com/ >
(C) Claris "ClarisWorks"	< http://www.claris.com/ >

PowerBook Computers: How Cold Temperatures Affect Them (3/97)

Revised: 3/4/97
Security: Everyone

PowerBook Computers: How Cold Temperatures Affect Them (3/97)

Article Created: 3 March 1997
Article Reviewed/Updated: 4 March 1997

TOPIC -----

How can a cold environment affect a PowerBook computer's Power Manager?

DISCUSSION -----

Issue

When a PowerBook computer's Lithium backup battery is exposed to cold temperatures it may cause the PowerBook computer to not keep time or not power on.

Description

A PowerBook computer's Power Manager and Parameter RAM (PRAM) are maintained by the backup battery when the PowerBook computer is either Shut Down or in Sleep mode.

The backup battery used in PowerBook computers is a Lithium battery which behaves differently compared to other battery types in both low-voltage and cold temperature situations.

Lithium batteries when exposed to a cold environment (less than 45 degrees Fahrenheit or 7 degrees Celsius) may either stop sending voltage completely or they may "pulse" full voltage. This inadequacy or inconsistency of voltage sent from the backup battery can corrupt the PRAM and/or Power Manager of a PowerBook computer.

Solution

A PowerBook computer which has recently been exposed to a cold environment (such as the trunk of a car, in a classroom at a school which may not be heated overnight, and so on) should be placed in a warm environment where it can be

warmed to room temperature (more than 50 degrees Fahrenheit or 10 degrees Celsius) before you attempt to power it on.

If the PowerBook computer still does not power on after being allowed to warm up, you should reset the ***Power Manager***. Each model of PowerBook computer has different methods for doing this. For more information on resetting the Power Manager for your PowerBook computer model see the Tech Info Library article 0014449, titled "PowerBook: Resetting Power Manager".

*** WARNING ***** WARNING ***** WARNING ***** WARNING ***** WARNING ***

Power Manager Reset procedures for all of the Macintosh PowerBook computers will permanently remove a RAM disk, if present, and all of its contents.

PowerBook 3400: Incompatible With FM Radio Extension (3/97)

Revised: 3/4/97
Security: Everyone

PowerBook 3400: Incompatible With FM Radio Extension (3/97)

=====

Article Created: 3 March 1997
Article Reviewed/Updated: 4 March 1997

TOPIC -----

The extension "FM Radio Extension" causes a crash on PowerBook 3400 series computers if it is present when the computer starts up.

DISCUSSION -----

The FM Radio Extension is installed by the TV/FM Software v1.5.3 (or 1.5.4) which comes with the TV/FM Tuner card. There is no reason that this software should be installed on a PowerBook computer since the TV/FM Tuner card cannot be installed in a PowerBook computer.

If you think you may have installed this extension and your PowerBook computer is now crashing while starting up, follow these steps:

Step 1

Restart the computer with the Shift key held down*.

Step 2

After the computer has started up, open the System Folder

Step 3

Open the Extensions folder

Step 4

Remove the "FM Radio Extension" from the Extensions folder.

Step 5

Restart the computer. The PowerBook will restart normally after removing the extension.

* NOTE: The Extensions Manager (accessed by holding down space bar at startup) will not recognize the FM Radio Extension, so you must start up with the Shift key held down which turns off all extensions.

Workgroup Server System & Network Software Compatibility (5/97)

Revised: 5/2/97
Security: Everyone

Workgroup Server System & Network Software Compatibility (5/97)

Article Created: 3 March 1997
Article Reviewed/Updated: 2 May 1997

TOPIC -----

Can you tell me which versions of System Software/Mac OS and server software are supported on the various models of Workgroup Servers (WGS)?

DISCUSSION -----

The following list details the server Workgroup server model and type, server software, and Mac OS versions that are supported, and not supported.

These Configurations Are Tested And Supported

68K* Workgroup Server, AppleShare 4.0.2, System 7.1, Classic Networking

PPC** Workgroup Server, AppleShare 4.2.1, Mac OS 7.6, OpenTransport 1.1.1

PPC Workgroup Server, AppleShare 4.2.1, Mac OS 7.6, OpenTransport 1.1.2

PPC Workgroup Server, AppleShare 4.2.1, System 7.5.5, OpenTransport 1.1.1
(with System 7.5.5 SCSI Server Update and PPC Interrupt Extension)

PPC Workgroup Server, AppleShare 4.2.1, System 7.5.5, OpenTransport 1.1.2
(with System 7.5.5 SCSI Server Update and PPC Interrupt Extension)

PPC Workgroup Server, AppleShare 4.2.1, System 7.5.5, Classic Networking
(with System 7.5.5 SCSI Server Update and PPC Interrupt Extension)

PPC Workgroup Server, AISS 2.x, Mac OS 7.6, OpenTransport 1.1.1
(with System 7.5.5 SCSI Server Update and PPC Interrupt Extension)

PPC Workgroup Server, AISS 2.x, Mac OS 7.6, OpenTransport 1.1.2
(with System 7.5.5 SCSI Server Update and PPC Interrupt Extension)

These Configurations Are Supported, But Not Tested

68K Workgroup Server, AppleShare 4.0.2, System 7.5.3, Classic Networking

These Configurations Are Not Supported

68K Workgroup Server, AppleShare 4.0.2, System 7.5.5, Classic Networking

68K Workgroup Server, AppleShare 4.0.2, System 7.5.5, OpenTransport 1.1.1

68K Workgroup Server, AppleShare 4.0.2, System 7.5.5, OpenTransport 1.1.2

68K Workgroup Server, AppleShare 4.0.2, Mac OS 7.6, OpenTransport 1.1.1

68K Workgroup Server, AppleShare 4.0.2, Mac OS 7.6, OpenTransport 1.1.2

Notes

- The 68K (or 680x0-based) Workgroup Servers include: the Workgroup Server 60, Workgroup Server 80, Centris 610, and Quadra 800.

- The PPC (Power PC-based) Workgroup Servers include: 6150, 7250, 8150, 8550, 9150.

- Mac OS 7.6.1 is not supported for use with AppleShare servers.

This article was published in the Information Alley on 3 March 1997.

PowerBook 500: Sound Manager 3.2.1 Static When Recording (3/97)

Revised: 3/4/97
Security: Everyone

PowerBook 500: Sound Manager 3.2.1 Static When Recording (3/97)

=====

Article Created: 3 March 1997
Article Reviewed/Updated: 4 March 1997

TOPIC -----

I have a PowerBook 520 computer, running System Software version 7.5.5. I just upgraded my QuickTime to version 2.5. Now when I record a sound through the Sound Control Panel, all that gets recorded is static. It did not do this before I upgraded to QuickTime 2.5. What is wrong?

DISCUSSION -----

Issue

There is a conflict between non-PowerPC 500 series PowerBook computers and Sound Manager version 3.2.1, which comes as part of the QuickTime 2.5 installation package.

Workaround

Remove the Sound Manager 3.2.1 extension from the Extensions folder, restart the computer, then record the sound.

This issue does not affect PowerBook 500 series computers that have been upgraded to PowerPC-processors with either Apple's or Newer Technologies' PowerPC upgrade cards.

Mac OS 7.6: Incorrect Message With Custom Remove (2/97)

Revised: 3/3/97
Security: Everyone

Mac OS 7.6: Incorrect Message With Custom Remove (2/97)

=====

Article Created: 3 March 1997

TOPIC -----

When I custom remove software using the Install Mac OS application on the Mac OS 7.6 CD-ROM disc, I receive a message saying the software was installed correctly. Was the software removed?

DISCUSSION -----

The software was indeed removed. A bug in the "Install Mac OS" application causes the installed correctly message to appear. If you remove the software using the Mac OS 7.6 Installer (found in the Software Installers folder in the Mac OS 7.6 folder on the Mac OS 7.6 CD-ROM), you will receive the correct message when you custom remove software.

PowerBook 3400: Starts From System CD By Default (3/97)

=====

Article Created: 3 March 1997
Article Reviewed/Updated: 4 March 1997

TOPIC -----

I have a Powerbook 3400 series computer which starts up with the System Software CD as the startup volume if the CD is in the CD-ROM drive when the computer starts up. Is this normal?

DISCUSSION -----

Yes, this is the normal and correct response to having the System CD inserted during the startup (boot) process in these computers. When the computer ships from the factory the Startup Disk Control panel is pre-configured with the CD-ROM as the default startup drive. This is only apparent when the PowerBook 3400 series System CD is actually inserted in the CD-ROM drive.

Resetting Parameter RAM (PRAM) will not disable this default startup setting. In order to disable this default open the Startup Disk Control Panel and select the hard drive as the startup drive.

Mac OS 7.6: Printers Aren't Appearing in Chooser (3/97)

Revised: 3/3/97
Security: Everyone

Mac OS 7.6: Printers Aren't Appearing in Chooser (3/97)

=====

Article Created: 03 March 1997

TOPIC -----

After installation of Mac OS 7.6 the Chooser window no longer shows any printers. How can I get my list of printers back?

DISCUSSION -----

It appears that you have inadvertently installed QuickDraw GX, which in turn disables all non-QuickDraw GX printers. If you use the Extensions Manager to disable the GX printer driver, the Chooser will be empty. Installing QuickDraw GX improperly may cause Type 1 Errors in the Finder.

Please follow the instructions from the Tech Info Library article titled "QuickDraw GX: How to Remove".

The QuickDraw GX 1.1.5 Installer is located in the "Software Installers" folder on the Mac OS 7.6 CD-ROM.

9600 Graphics Accelerator extension: Why Is It There? (3/97)

Revised: 3/10/97
Security: Everyone

9600 Graphics Accelerator extension: Why Is It There? (3/97)

=====

Article Created: 3 March 1997
Article Reviewed/Updated: 10 March 1997

TOPIC -----

I have a Power Macintosh 7300. When I start up my computer and watch the screen as the extensions load, I see a large red X through the icon of one of the extensions. The extension is named "9600 Graphics Accelerator". Is there something wrong? Do I need this extension on my Power Macintosh 7300?

DISCUSSION -----

There is nothing wrong. The file, named "9600 Graphics Accelerator", will do no harm. You may safely remove it from your Power Macintosh 7300 if you wish.

The 9600 Graphics Accelerator extension was included as part of a standard bundle of system software which was installed on Power Macintosh 7300, 7600 (Japan only), 8600, and 9600 systems at the factory. On systems that don't need this extension, a red X will be displayed across the extension's icon when the system starts up. The 9600 Graphics Accelerator extension will not be loaded, and there is no harm done.

Future versions of this system software bundle will not exhibit this behavior.

Find File Does Not Have Enough Memory (2/97)

Revised: 3/3/97
Security: Everyone

Find File Does Not Have Enough Memory (2/97)

=====

Article Created: 3 March 1997

TOPIC -----

When attempting to do a simple file name search with Find File I get a "not enough memory" message. I have 40 MB of physical RAM, virtual memory is off, and the operating system is taking up about 10 MB of RAM. Prior to getting this error, I had set the find file desktop pattern to the blue plaid pattern in the desktop patterns control panel. I decided to remove the desktop pattern from Find File, and the not enough memory message went away. How can change the pattern in Find File and have enough memory?

DISCUSSION -----

Using a desktop pattern on the Find File utility does use a bigger portion of Find File's available memory. To workaroud this, increase the memory for the Find File utility because it is actually an application.

To increase the memory for Find File:

Step 1

Make sure you have Quit the Find File utility.

Step 2

Open the Apple Menu Items folder in the System Folder

Step 3

Highlight the Find File utility and select Get Info from the File menu

Step 4

Increase the Preferred memory size to 560.

Step 5

Close the Find File Info window.

Energy Saver: Saving Preferences (3/97)

=====

Article Created: 3 March 1997
Article Reviewed/Updated: 4 March 1997

TOPIC -----

My Energy Saver software doesn't appear to be working properly. I used the Energy Saver control panel to schedule a specific shutdown time. The computer shuts down automatically, but not at the time I designate. What's wrong?

DISCUSSION -----

The Energy Saver software is not saving your request correctly. This can occur if the control panel is closed while displaying the "Scheduled Startup & Shutdown" options in Energy Saver's window. There is a workaround. Follow these steps to ensure your startup and shutdown settings are saved:

STEP ONE

Open the Energy Saver control panel. Set startup and shutdown times for the computer as desired.

STEP TWO

Click the "Sleep Setup" button in the Energy Saver control panel window.

STEP THREE

Close the Energy Saver control panel.

This issue will be addressed in a future revision of the system software.

Apple Network Server: Setup & Config a PPP Client In AIX (2/97)

Revised: 3/10/97
Security: Everyone

Apple Network Server: Setup & Config a PPP Client In AIX (2/97)

Article Created: 4 March 1997
Article Reviewed/Updated: 10 March 1997

TOPIC -----

This article describes how to setup a PPP client and then configure it for AIX on an Apple Network Server.

DISCUSSION -----

Follow the steps below:

Step 1

Add this line to your '/etc/uucp/Devices' file:

Direct tty0 - 38400 direct

Step 2

Create a tty on serial port 1.

NOTE: Be sure to create the tty with rtc/cts flow control and speed 38400.

The following command will create a tty1 on serial port 1:

```
mkdev -c tty -t tty -s rs232 -p sa1 -w s1 -a speed=38400 -a flow_disp=rts
```

Step 3

Edit the 'rc.net' file (located in the '/etc' directory) and turn on IP forwarding by adding this to the last line:

```
no -o ipforwarding=1
```

NOTE: You can type this on the command line, but you will have to type it at

system reboot, so you can put this command in the 'rc.net' file once.

Step 4

Type "smitty ppp" and select Link Control Configuration and add a link using the sample below will work in most cases.

Begin_Table

LINK Configuration

Type or select values in entry fields.
Press Enter AFTER making all desired changes.

	[Entry Fields]
PPP subsystem name	[new]
max server connections	[1]
max client connections	[1]
max demand connections	[1]
max ip interfaces	[2]
max async hdlc attachments	[2]
mrui	[]
async character map	[]
negotiate MRU	yes
negotiate async map	yes
negotiate protocol compression	yes
negotiate address control compression	yes
force authentication	no
chap interval	[]

End_Table

The settings above should let you setup an additional PPP interface in case you choose to setup a PPP server.

Step 5

Start the PPP subsystem by typing the following command:

```
startsrc -s pppcontrold
```

Step 6

Modify your '/etc/ppp/dial_out.example'

All you need to add is name, password, and phone number.

Step 7

Run the dialer script from the '/etc/ppp' directory

```
./dial_out.example
```

Step 8

Wait for a connection and set your default route.

```
route add 0 gateway_address
```

Debugging Information

You can use the 'syslog' file for debugging, this file displays on the root console when activated. You need to modify the 'syslog.conf' file to display debugging information by un-commenting this line in the '/etc/syslog.conf' file:

```
*.debug                /dev/console
```

For this change to become active, you have to refresh the syslogd subsystem by typing:

```
refresh -s syslogd
```

NOTE: We have found it best to use two xwindows for the debugging process. The first window opened can be the console and all debug messages will be sent to it. To use xwindows, exit to command line login from the options button of the dtlogin. At the command line, type "xinit".

Sample Dialer Script

Begin_Table

Below is an example of a dialer script:

```
startsrc -s pppcontrold          # Start the pppcontrold subsystem
sleep 5
USER=ppp                        # User ID
PASSWORD=ppp                    # Password
NUMBER=xxx-xxx-xxxx             # Internet Provider phone number
CHATFILE=./chatfile
cat << EOF > $CHATFILE
\"\"
at
OK
atdt$NUMBER
CONNECT
\"\"
ogin
$USER
ssword
$PASSWORD
EOF
/usr/sbin/pppattachd client $TTY connect /usr/sbin/pppdial -v -f $CHATFILE
sleep 40                        # Wait 40 to establish connection
route add 0 xxx.xx.xx.x         # Set the default gateway
```

End_Table

Apple Media Tool 2.1.1: Sound Conversion to WAV Fails (3/97)

Revised: 3/5/97
Security: Everyone

Apple Media Tool 2.1.1: Sound Conversion to WAV Fails (3/97)

=====

Article Created: 4 March 1997

TOPIC -----

I am using the AMT Converter, which came with Apple Media Tool 2.1.1, to convert AIFF sound files to WAV sound files. However, the conversion fails and the log reports "...Unknown Error". This fails with both 8-bit and 16-bit AIFF files.

DISCUSSION -----

When you install Apple Media Tool 2.1.1, QuickTime 2.5 is installed. The issue you are experiencing is related to an incompatibility with QuickTime 2.5 and the AMT Converter. In order to convert AIFF sound files into WAV sound files, remove QuickTime 2.5 and install QuickTime 2.1. When you do use the older version of QuickTime, you can successfully convert the sound files.

LaserWriter Driver 8.4.2: Change in New Version (3/97)

Revised: 3/4/97
Security: Everyone

LaserWriter Driver 8.4.2: Change in New Version (3/97)

=====

Article Created: 4 March 1997

TOPIC -----

What are the new changes in the LaserWriter 8.4.2 driver that is installed with Mac OS 7.6?

DISCUSSION -----

LaserWriter driver version 8.4.2 had one single fix relating only to Adobe's PageMaker v6.0 and v6.01:

1) A problem was resolved where one extra blank page was printed at the end of every print job.

The updated version of Desktop PrintMonitor v2.0.2 also shipping with LaserWriter 8.4.2 in System 7.6 has a couple of fixes as well. They are:

1) Error type 15 and/or -192 occurring on Mac OS computers with a PowerPC card. These errors only occurred when trying to create, open, or print to a desktop printer.

2) Finder getting confused when a folder's directory ID matches that of the PrintMonitor Documents folder. Finder may not display that folder or its contents, and other strange behavior may occur with that specific folder.

Apple CD-ROM Software 5.3.2 Read Me (3/97)

=====

Article Created: 4 March 1997

TOPIC -----

This article contains the ReadMe document included with Apple CD-ROM software version 5.3.2.

DISCUSSION -----

About Apple CD-ROM Version 5.3.2

This file includes important information about Apple CD-ROM version 5.3.2, software that lets you use an Apple CD-ROM drive with your Macintosh computer. You need system software version 7.1 or later of the Macintosh Operating System (Mac OS) to use this software. Because this information is not included in the documentation accompanying the product, you may want to print it. To do so, choose Print from the File menu.

Installation Instructions

IMPORTANT The full instructions below assume you have an Apple CD-ROM installation disk. If, instead, you're downloading the Apple CD-ROM software from an online service, follow step 1, below. Next, copy the software onto your hard disk and double-click the Installer icon to start the Installer. Then follow steps 5 through 9.

To install this extension, follow these steps:

1. While holding down the Shift key, choose Restart from the Special menu and continue to hold the key down until you see a message. When a message on the screen tells you that the extensions are off, release the Shift key.

When you restart the Macintosh after you install Apple CD-ROM version 5.3.2, the extensions will turn on again.

2. Make sure the Apple CD-ROM installation disk is locked.

3. Insert the Apple CD-ROM installation disk into a disk drive.

If you can't see the Installer icon, double-click the disk icon to open it.

4. To start the Installer program, double-click its icon.

5. In the Welcome dialog box that appears, click Continue.

After a moment, the Install dialog box appears.

IMPORTANT When you started the Installer, it checked to make sure you have what you need to use the software. If you're missing anything, you'll now see a message that tells you what you need. You won't be able to install the software until you correct the problem. If a dialog box says you don't have the correct system software, you can purchase a new version of system software from an Apple-authorized dealer.

6. Make sure the disk named in the Destination Disk box is the one on which you want to install the software. If it's not, click Switch Disk until the correct disk name appears.

7. Click the Install button.

The Installer takes a few moments to calculate what needs to be done and then begins to install files.

8. Follow the instructions on the screen until the installation is complete.

9. When you see a message reporting that installation was successful, click Restart to restart your Macintosh.

The Apple CD-ROM software is now installed on the hard disk.

Improvements to the Software

Version 5.3.2

For CD Extra discs, the Apple CD-ROM software mounts both the HFS and ISO partitions (if present), allowing AppleCD Player to locate and use the CD Extra data regardless of what partition it is on.

Version 5.3.1

Previously you may have received occasional error messages when scanning (fast-forwarding) between tracks in shuffle and program modes. This problem has been corrected in version 5.3.1.

Version 5.3

The Apple CD-ROM software supports all current Apple CD-ROM drives.

Version 5.2

The Apple CD-ROM software now supports ATAPI CD-ROM drives, such as those used in the Macintosh PowerBook 1400.

Previously system errors could occur when a shared CD-ROM drive was accessed by a client computer. This has been corrected in version 5.2.

Previously the CD-ROM drive may have gone into sleep mode while playing an audio CD. This problem has been corrected in version 5.2.

Version 5.1.7

The Apple CD-ROM software now works with 6x-speed CD-ROM drives.

Version 5.1.6

The Apple CD-ROM software now works with Apple PC Compatibility Cards for PCI-based Macintosh computers.

Version 5.1.5

If you have an Apple CD-600 drive and were using Apple CD-ROM version 5.1, you may have had intermittent problems playing the Peter and the Wolf CD. In version 5.1.5, this problem has been corrected.

Previously a Photo CD with more than 30 sessions would not start up properly. Now a Photo CD of up to 50 sessions (the theoretical maximum number of sessions on a Photo CD) will start properly.

PowerBook 3400: Ethernet/Modem Card Questions (5/97)

Revised: 5/2/97
Security: Everyone

PowerBook 3400: Ethernet/Modem Card Questions (5/97)

=====

Article Created: 4 March 1997
Article Reviewed/Updated: 2 May 1997

TOPIC -----

Is the modem that came with my PowerBook 3400 series computer made by Apple or Asante? Who supports it? If I had bought a PowerBook 3400 series computer that did not come with this modem, could I buy it later from Apple?

Do I have to use the "dongle" even if I'm not using Ethernet?

Tell me about the phone cord supplied with the computer for this pre-installed, internal modem. Do I have to use this one? Can I not use just a regular phone cord like I have at my house? What will happen if I use a four-wire cord?

Does the internal modem that comes with the PowerBook 3400 support cellular communications?

DISCUSSION -----

Modem Technical Support

The combination Ethernet/modem card included in most PowerBook 3400 series computer configurations in US and Canada (and in all configurations sold in Japan) is actually produced by Asante. However, it is sold as an Apple-labeled (not Asante-labeled) part when it is included in a PowerBook 3400 series configuration. Apple is responsible for all service and support for these configurations.

If US or Canadian customers purchase a PowerBook 3400 series computer without the internal Ethernet/modem card included, Apple does not supply this card as a stand-alone item for later purchase. However, the card can be purchased from Asante. When sold by Asante, the card is Asante-labeled (marked as such on the card) and supported by Asante, not by Apple.

The Ethernet/Modem Adapter

You do not need to use the Ethernet/modem adapter (dongle) which is supplied with your PowerBook 3400 series computer if you are using only one function at a time. Either a modem cord or a 10BaseT Ethernet cord can be plugged into the single port on the back panel of the computer. The port will recognize the type of cable that is plugged into it and it will act accordingly. The adapter is only needed if you want both Ethernet and modem at the same time.

The Phone Cord

The phone cord supplied with PowerBook 3400 series computers is a two-wire (single-line) phone cord in which only the center two pins are connected. The cord has a label on it instructing you to use only a two-wire (single-line cord) for the PowerBook 3400 series internal modem. If you lose or break the cord it should be replaced with a two-wire cord (available at most electronic stores).

If you use a four-wire phone cord, in most cases, it will work just fine. However, it is recommended that you use the two-wire cord because, if the telephone outlet plug to which you connect the cord carries two phone lines, including a second phone line over the outer pins of the RJ-11, the second phone line will be connected to the Ethernet circuit.

Although this should cause no permanent damage, the second phone line will be taken "off hook" and may cease to function properly while the phone cord is plugged into the PowerBook 3400 computer. If when you plug in your modem your other phone line stops working, check to make sure you are using a two-wire (single-line) phone cord.

A four-wire phone cord should work fine with the Ethernet/modem adapter (dongle). The dongle only has two pins which hook up to the wires on the phone jack. A four-wire phone cord will not take the second line "off hook", but you cannot access the second line from your PowerBook 3400 series computer if you use this type of cord.

Cellular Communications

The PowerBook 3400 series computer's internal modem card does not support cellular communications. Future versions of the card may support cellular communications. Asante is looking at possibly supporting cellular with the next revision of the card. They have made no commitment on when that card may be available.

This article was published in the Information Alley on 5 March 1997.

Article Change History:

02 May 1997 - Added cellular communications section.

CyberDog 1.2.x: APOP Password Authentication (3/97)

Revised: 3/4/97
Security: Everyone

CyberDog 1.2.x: APOP Password Authentication (3/97)

=====

Article Created: 4 March 1997

TOPIC -----

I have configured CyberDog to retrieve my mail from my company's POP mail server. However, when I click the "Check" button, an error occurs. A dialog box states, "Could not complete the requested action for unknown reasons." What is wrong?

DISCUSSION -----

This error is pretty non-descriptive, but one of the reasons this error will occur is the mail server is configured to use APOP password authentication. With APOP, the password is sent to the mail server in an encrypted form rather than in clear text.

Currently, 1.2.x versions of CyberDog do not support APOP password authentication. The user must ask their mail administrator to disable the APOP requirement for their account.

NOTE: CyberDog 2.0, when released, will support APOP password authentication, as demonstrated in the currently available CyberDog 2.0b1 beta software. Users can download this version from the CyberDog Home Page at <http://cyberdog.apple.com/>. Note that beta versions of software are not supported by AppleAssist.

About Getting Started With Cyberdog 1.2 (3/97)

Revised: 3/4/97
Security: Everyone

About Getting Started With Cyberdog 1.2 (3/97)

=====

Article Created: 4 March 1997

TOPIC -----

This article describes the Getting Started With Cyberdog 1.2 user's manual, including where to find it and how to read it with Adobe Acrobat Reader.

DISCUSSION -----

The Getting Started With Cyberdog 1.2 user's manual describes how to use Cyberdog to explore the World Wide Web, use e-mail, use Internet services such as Telnet, access AppleShare volumes from the browser, and create cyberdocuments. The manual is located in the Cyberdog Information folder on the Mac OS 7.6 CD-ROM disc. (The Cyberdog Information folder is located in the Additional Mac OS Information folder, which is in the Mac OS 7.6 Information folder.)

You must use the Adobe Acrobat Reader program to read this manual on your computer's monitor screen. You can also use the Acrobat Reader program to search for specific text in the manual or to print a copy of the manual.

Installing the Acrobat Reader

=====

To install the Acrobat Reader:

1. Insert the Mac OS 7.6 CD.
2. Open the Adobe Acrobat Reader folder in the Utilities folder and follow the installation instructions in the file named "Installing Acrobat Reader."

Viewing The Manual

=====

To view the manual, double-click the manual's Portable Document Format (PDF) icon. The PDF file is located on the Mac OS 7.6 CD, in the "Additional Mac OS Information" folder within the "CyberDog Information" folder. It can also be downloaded from the Cyberdog web site at <http://cyberdog.apple.com/>

The Acrobat Reader program requires more than 3.5 megabytes of memory for proper operation. Two error messages may appear if Acrobat Reader does not have enough memory to open a document. The first message states that the Adobe Type Manager (ATM) couldn't be installed because it requires more memory or additional system software resources. When you click OK to dismiss the message, a second message appears stating that ATM version 3.6 or newer must be installed and that Acrobat Reader is quitting.

Usually, the reinstallation process recommended by these messages is not necessary. Instead, try making more memory available by quitting other applications that are running on your computer. Then attempt to reopen the PDF document.

Using the Acrobat Reader

=====

If you want more information about using the Acrobat Reader:

- Read the Acrobat Reader On-line Guide (open the file called "Help-Reader.pdf" in the Help folder, located in the Adobe Acrobat Reader folder) for detailed information about using Acrobat Reader.
- Read the file called "Installing Acrobat Reader" (located in the Adobe Acrobat Reader folder in the Utilities folder) for the latest troubleshooting information on the Acrobat Reader, as well as for important information about installing the Acrobat Reader software.

Apple Internet Connection Kit 1.2: Read Me (3/97)

Revised: 3/5/97
Security: Everyone

Apple Internet Connection Kit 1.2: Read Me (3/97)

=====

Article Created: 5 March 1997

TOPIC -----

This article is the Apple Internet Connection Kit (AICK) 1.2: ReadMe file.

DISCUSSION -----

Important information about the Apple Internet Connection Kit 1.2

Before you install the Apple Internet Connection Kit, please read the following information.

Getting Help For Installing and Using Your Apple Internet Connection Kit

=====

Apple will assist you with the installation and setup of the Apple Internet Connection Kit. Our specially trained telephone support staff can assist you with information on:

- Installation
- Registration
- Configuration

Once you have selected and registered with an Internet service provider (ISP), the provider will be able to assist you with:

- Basic product use
- Application questions or issues
- Billing issues
- Connection questions and problems

Please contact the respective third-party companies regarding any questions or support issues with the following applications:

- Netscape Navigator
- Claris EMailer
- Fetch
- NCSA Telnet
- NewsWatcher

If you are accessing the Internet via a LAN connection, contact your network administrator for help with setting up the Apple Internet Connection Kit.

Telephone support is available Monday through Friday (excluding holidays) from 6 a.m. to 6 p.m. Pacific Standard Time. In Canada, hours are 8 a.m. to 8 p.m. Eastern Standard Time. For the appropriate phone number to call for support, see the support materials that came with your product.

Technical information and product updates for the Apple Internet Connection Kit are available on the Internet at <http://aick.apple.com>.

Apple also provides an excellent online reference source for technical information: the Apple Tech Info Library. You can search through thousands of articles on Apple products, past and present, updated regularly by Apple Support personnel. The Apple Tech Info Library (TIL) is available on the Internet (<http://www.info.apple.com/til.html>), AppleLink (Support -> Tech Info Library), and CompuServe (GO APLTIL).

System Requirements

=====

- Power Macintosh or Macintosh computer with a 68030 microprocessor or greater
- System 7.5.1 or later; if you have System 7.5.2, you must upgrade to System 7.5.3 or later (System 7.5.3 and System 7.5.5 are included on the Internet Connection Kit CD)
- MacTCP (2.0.6 or later) or Open Transport (1.1 or later)
- 12 megabytes (MB) of random-access memory (RAM), 16 megabytes is recommended. If you have less than you 16 megabytes of RAM, you must turn on virtual memory (VM); see Macintosh Guide for details about how to use VM.
- 25 megabytes (MB) of hard disk space

Installing and Setting Up the Apple Internet Connection Kit

=====

Make sure you've quit all open applications before you install the Apple Internet Connection Kit.

To install the Apple Internet Connection Kit on your hard drive, insert the Internet Connection Kit CD (or the first floppy disk if installing from floppies). Next, double-click the 'Installer' icon and then follow the instructions on your screen. When installation is complete, click the 'Apple Internet Dialer' icon in the Launcher window and follow the instructions that appear on-screen.

If you already have Netscape Navigator, Fetch, MacTCP or PPP installed on your computer before you install the Apple Internet Connection Kit, a 'Backup Folder' will be created. This folder will contain a document titled 'Restoring Backup Items' with instructions about restoring these files.

If You Already Have an Internet Service Provider

To connect to the Internet using an account you already have with an ISP, choose the Set Up Existing Account command in the Provider menu. You may need to call your ISP to obtain some setup information that is requested in the sequence of panels that appear.

Problems While Creating a New Account

When you create a new account with an ISP by using the Apple Internet Dialer, the Dialer will gather some personal information from you (such as your name and address) and then it will connect to the registration server and open Netscape Navigator. (The registration server is the host computer your Macintosh initially connects to and offers you a list of service providers to choose from.) If your network connection drops (that is, for some reason "breaks") while you are trying to create an account, or there is some problem you encounter with the registration server, you need to quit the Netscape Navigator application. Once you quit, the Apple Internet Dialer will offer you the option to cancel or continue the process of creating a new account. Click Continue to try to create a new account again immediately, or click Cancel and try later.

NOTE: Do not change the phone number that you see in the "Connect to Internet Registration Server" dialog box of the Apple Internet Dialer. If you erase the number inadvertently, you can retype the number in the Number text box. In the United States and Canada, the number is 1-800-247-5067. Outside the United States and Canada, contact your local Apple representative or dealer.

Adding or Modifying Modem Information

If your modem is not listed in the Modem pop-up menu in the Apple Internet Dialer, you can add or modify information about your modem. Please refer to the "Adding or Modifying Modem Information" section in chapter 3 of the printed "Getting Started" manual (and also located inside the 'Documentation' folder on the Internet Connection Kit CD).

Choosing a Modem Port When Using a PowerBook Computer With a PC Card Modem

To choose the modem port when you use a PC card modem, choose the slot ("Upper PC Card slot" or "Lower PC Card slot") that the card is in from the Port pop-up menu in the Apple Internet Dialer.

Each time you remove the card (whether you move the card to a different slot or reinsert the card in the same slot as before), you must reselect the modem port as described in the previous paragraph. To move the card to a different slot, you must quit the Apple Internet Dialer before you move the card.

Using or Deselecting the Launcher

The Launcher window provides an easy way to open programs and other items; you click a Launcher button once to open the item it represents. The Launcher is set to open automatically after you've installed the Apple Internet Connection Kit.

If you don't want to use the Launcher interface for accessing the applications in the kit, open the General Controls control panel and deselect (remove the X) the "Show Launcher at startup time" option.

Saving Internet Service Provider Account Information

You will be asked to write down your user name and password after creating an account with an ISP. You can write the information down on paper, or you can retain this information on your computer by following these steps:

1. Press Command-Shift-3 to take a screen shot of what is on your monitor screen; the screen shot will be saved on your hard drive with the name "Picture 1," and the file can be opened with many applications, including SimpleText.
2. Select the image and copy it into your Scrapbook.

If you forget to write the information down, you will need to contact your ISP to get that information, should you need it. Apple will not be able to assist you with recapturing this information.

Backing Up Your Internet Service Provider Information

Once you have successfully created an account with an ISP, it is recommended that you back up the preferences and settings in case you need to restore them. You can do this by opening the Apple Internet Dialer and selecting Back Up Provider Information from the File menu.

Restoring Your LAN Configuration

If you inadvertently installed the Dialup configuration over your existing Internet LAN configuration, you can restore your settings by following the steps provided in one of the sections below, as appropriate for your MacTCP or your Open Transport system:

If you have MacTCP:

1. Open the 'Internet Connection Kit' folder.
2. Open the folder called 'Backup Folder'.
3. Copy the 'MacTCP Prep' file from the 'Backup Folder' into the 'Preferences' folder inside your System Folder.
4. Restart your machine.

If you have Open Transport:

1. Open the 'TCP/IP' control panel.
2. Choose Configurations from the File menu.
3. In the list of configurations, click Default to highlight it (if it isn't already).

4. Click the Make Active button.
5. Close the 'TCP/IP' control panel.

Connecting to a News Server for the First Time

Connecting to a news server for the first time or switching ISPs can take from one minute to more than 20 minutes, depending on your ISP's configuration. If there is a large number of newsgroups to download from your ISP's news server, the initial connection time could be quite lengthy. Subsequent connections are likely to be much quicker.

Using Open Transport

Open Transport version 1.1 or later is required for use with the Apple Internet Connection Kit. If your computer came with System 7.5.3 or later installed, you already have Open Transport 1.1 or later. If you have a version of system software earlier than System 7.5.3, you can use the System 7.5 Update 2.0 (located on the Internet Connection Kit CD in the 'Mac OS Updates' folder) to install Open Transport version 1.1.

NOTE: It is recommended that you relaunch the Apple Internet Dialer once you have registered with an ISP. Otherwise you may encounter problems the first time Netscape Navigator is launched. This is not necessary for MacTCP users.

Using System 7.5.2

The Apple Internet Connection Kit does not work with System 7.5.2. Please upgrade to System 7.5.3 or System 7.5.5 (located on the Internet Connection Kit CD in the 'Mac OS Updates' folder) before installing this product.

Using Netscape 2.0

The Installer will place Netscape 3.0 on your disk without removing Netscape 2.0. If you decide to use Netscape 2.0 instead of Netscape 3.0, you will not be able to register with a new ISP using the Apple Internet Dialer because Netscape 2.0 is incompatible with the updated system software that has been installed. You should only attempt to use Netscape 2.0 if you have already established an account with an ISP and do not wish to create a new account.

Using Telnet 2.6

The NCSA Telnet 2.6 application will not operate correctly unless you have created an account with an Internet service provider or you have set up your LAN connection.

Using the Correct Version of MacPPP

The Apple Internet Connection Kit requires MacPPP version 2.5.1 or later. If you have a version of MacPPP earlier than version 2.5.1 installed on your machine, you should replace it with the version provided in your package. The Apple Internet Connection Kit Installer does this for you automatically. Older versions of MacPPP, including MacPPP 2.1.4 and 2.2, are not compatible with the Apple Internet Connection Kit and should not be used. Other implementations of

PPP are not supported.

To find out what version of MacPPP you have, open the 'Extensions' folder inside your System Folder. Click the icon for the 'PPP extension', and choose Get Info from the File menu.

Using SLIP Software

The Apple Internet Dialer is configured to use the MacPPP software that is included with this kit. InterSLIP software is included with the Apple Internet Connection Kit as a convenience, but it will not work with the Apple Internet Dialer. If you need to use a SLIP connection, contact your Internet service provider for instructions on setting up and configuring your system using SLIP software.

Troubleshooting Insufficient Memory Messages

If you are attempting to run several Internet applications simultaneously and you see a message indicating that your system does not have enough memory to run an application (or if you see an insufficient memory message the first time you attempt to use the Apple Internet Dialer), you can try one of the following:

- Close all unnecessary applications.
- Turn on virtual memory (VM); see Macintosh Guide for details about how to use VM.
Note: For best performance, never set VM to more than twice the amount of physical RAM (if you have a 12 MB system, VM should be no more than 24 MB).
- Install more RAM.

What Is Installed in Your System Folder?

After doing an Easy Install, the Apple Internet Connection Kit puts the following items in various places in your System Folder:

- Apple Guide 2.0.2
- ATM Font Database
- ObjectSupportLib 1.1.1 (AppleScript document)
- PPP 2.5.1 (MacPPP) extension and (if necessary) PPP Preferences (Preferences folder)
- MacTCP 2.0.6, MacTCP Prep, MacTCP TokenRing extension, Hosts file (all are installed only if you do not have OpenTransport)
- Internet Config extension and Internet Config Preferences
- Internet Dialer Folder (Preferences folder)
 - Modem Information
 - Internet Dialer Prefs
 - reg server
- Launcher 2.8, and Launcher Preferences
- Netscape preferences (Preferences folder)
- Additional fonts

Cyberdog 1.2.1: Read Me File (3/97)

Revised: 3/5/97
Security: Everyone

Cyberdog 1.2.1: Read Me File (3/97)

Article Created: 5 March 1997

TOPIC -----

This article contains the Read Me document for Cyberdog 1.2.1.

DISCUSSION -----

About Cyberdog 1.2.1

What is Cyberdog?

Cyberdog is a suite of Internet components that allows you to browse the World Wide Web, receive and send e-mail, read articles from Usenet newsgroups, browse AppleTalk zones and servers, exchange files with FTP, and log into other computers with Telnet. Cyberdog provides tight integration between these components, and with other OpenDoc applications. Cyberdog also allows you to customize your use of the Internet. These capabilities make Cyberdog more appropriate for Internet-savvy users.

System Requirements

Cyberdog requires a Power Macintosh and at least 16 megabytes of memory. (If less than 16mb of RAM is installed in your computer, use the Memory control panel to turn on Virtual Memory and set the amount of memory to 16M.) Cyberdog also requires System 7.5.3 or later, OpenDoc version 1.1 or later, and MacTCP 2.0.4 or later or Open Transport 1.1 or later with TCP/IP installed and configured.

IMPORTANT Install OpenDoc 1.1 or later before installing Cyberdog.

Connection Requirements

Cyberdog requires that you have Internet connectivity through either a dial-up connection with an Internet Service Provider (ISP), or a local area network (LAN) with an Internet connection. Before using Cyberdog, check that you have

such service. If not, you can use the Apple Internet Connection Kit to register and configure your computer with an ISP, contact an ISP directly, or contact your network administrator.

Using the Mail System

To use the Cyberdog mail system you will need an SMTP/POP3 account from your ISP or your network Intranet services group. If you do not already have a mail account, you will need to obtain one. Once Cyberdog has been installed, set up a connection to your mail server by selecting the "Mail & News Setup" item from the Mail/News menu.

If you are currently using Internet Config 1.2 or later and have set up your mail account, your Cyberdog mail connection will already be configured. If you already use Internet Config, please make sure you upgrade to version 1.2 or later.

QuickTime

To play movies and sounds in Cyberdog you need to have QuickTime version 2.1 or later installed.

Reporting Problems

To report problems with Cyberdog 1.2.1, please consult our Feedback Web Page at [<http://cyberdog.apple.com/feedback.html>](http://cyberdog.apple.com/feedback.html)

Important Notes

For a complete list see

[<http://cyberdog.apple.com/br/releasenotes.html>](http://cyberdog.apple.com/br/releasenotes.html)

1. Enclosures sent to users of Claris EMailer and America Online must be sent in Plain Text mode (as opposed to Rich Text) in order for the enclosures to be received correctly.
2. Plain Text enclosures are sent in the binhex format.
3. Cyberdog 1.2.1 Cyberbuttons are not compatible with previous versions of Cyberdog. Users of earlier versions of Cyberdog will have to upgrade to use them.

AppleTalk Options Control Panel: Read Me (3/97)

Revised: 3/5/97
Security: Everyone

AppleTalk Options Control Panel: Read Me (3/97)

=====

Article Created: 5 March 1997

TOPIC -----

This article is the AppleTalk Options Control Panel ReadMe file.

DISCUSSION -----

AppleTalk Options Control Panel Read Me

IMPORTANT: Do not use the AppleTalk Options control panel unless instructed to do so by your network administrator. AppleTalk Options control panel is an unsupported utility developed by Apple Computer, Inc. and requires OT 1.1.1b6 or a later release of Open Transport. Future releases of Open Transport (version 1.5 and later) will provide this capability without requiring this separate control panel.

About the AppleTalk Options Feature

This feature allows a user to suppress unwanted router-related alerts.

Why Suppress Router-Related Alerts?

Some Ethernet-ISDN bridges used for remote LAN-to-LAN connectivity drop the connection when there is no active data transfer, and dial on demand when there is information to be transferred. If a user's local network does not include an AppleTalk router, a message appears each time the connection is dropped. Use the AppleTalk Options control panel to prevent the alerts from being displayed.

Disabling the Router-Related Alerts Feature

To install and use the AppleTalk Options control panel, follow these steps:

1. Drop the AppleTalk Options control panel onto a closed System Folder.
2. Open the Control Panels folder from the Apple menu.
3. Open the AppleTalk Options control panel.
4. To eliminate unwanted alerts, click the "Suppress router-related alerts" checkbox to put a check in it.
5. Close the AppleTalk Options control panel.
6. Either turn AppleTalk off and on, or reboot your system in order for your setting to take effect.

Re-Enabling the Router-Related Alerts Feature

To revert to the normal Open Transport mode, uncheck the "Suppress router-related alerts" check box in the control panel and reboot your system.

WARNING: Simply removing the control panel from your Control Panels folder does not re-enable the alerts. You must uncheck the "Suppress router-related alerts" checkbox in the control panel.

MacPPP 2.5 Read Me for Open Transport 1.1 (3/97)

Revised: 3/5/97
Security: Everyone

MacPPP 2.5 Read Me for Open Transport 1.1 (3/97)

=====

Article Created: 5 March 1997

TOPIC -----

This article is the MacPPP 2.5 ReadMe file for Open Transport 1.1.

DISCUSSION -----

Introduction

=====

MacPPP allows you to use a modem (or ISDN terminal adapter) to connect to Internet services using Point-to-Point Protocol (PPP). Version 2.5 of MacPPP is fully compatible with Open Transport TCP/IP. You should replace any previous versions of MacPPP (particularly versions 2.0.1 or 2.2.0) with version 2.5.

MacPPP includes three files:

- PPP is an extension file that adds PPP capability to the Open Transport TCP/IP control panel.
- ConfigPPP is a utility program you use to set up your PPP options.
- This Read Me document.

MacPPP 2.5 is included here as a convenience for customers who have previously obtained versions of MacPPP from another source. This distribution does not include technical support from Apple Computer, Inc. MacPPP is not part of Open Transport.

Other Point-to-Point Protocol Software

=====

FreePPP

FreePPP is another extension providing Point-to-Point Protocol connectivity. FreePPP 1.0.4 (or later) is compatible with Open Transport.

To obtain the latest version of FreePPP, refer to the FreePPP World Wide Web home page at <http://www.rockstar.com/ppp.html> for more information.

Commercial PPP Software

If you prefer to use a commercially supported implementation of PPP, contact one of the third party developers listed in the Open Transport Read Me document, or purchase a copy of the Apple Internet Connection Kit. Technical support for MacPPP is provided as part of the kit.

Changes in MacPPP

=====

MacPPP 2.5 is compatible with Virtual Memory.
Versions of MacPPP prior to 2.1.2SD were not compatible with Open Transport.

Installing MacPPP

=====

Before you install

Remove all copies of PPP from the Extensions folder inside the System Folder of your startup disk. Also remove all copies of ConfigPPP from the Control Panels folder inside the System Folder of your startup disk.

Installing MacPPP

To install MacPPP, follow these steps:

1. Drag the PPP icon to the icon of your System Folder (not to the open System Folder window). A dialog box appears asking if you want to move PPP to the Extensions folder.
2. Click OK. PPP is placed in the Extensions folder inside your System Folder.
3. Drag the ConfigPPP icon to the icon of your System Folder (not to the open System Folder window). A dialog box appears asking if you want to move ConfigPPP to the Control Panels folder.
4. Click OK. ConfigPPP is placed in the Control Panels folder inside your System Folder.
5. Choose Restart from the Special menu. When your computer starts up again, PPP is installed.

Setting Up MacPPP

If you previously used a version of MacPPP, your PPP preferences are still in effect with MacPPP 2.5. To set up or change your PPP preferences:

- Copy a previous version of the PPP Preferences file to the Preferences folder in the System Folder of your startup disk.

-OR-

- Open ConfigPPP and choose the settings you want to use.

If you have the Apple Internet Connection Kit, you can use the Apple Internet Dialer to set up MacPPP.

For more information about setting up and using MacPPP or FreePPP, see the documentation that came with your original copy of these software packages. You may also find useful information on the Internet, in such newsgroups as comp.mac.sys.comm.

Remote Only 2.1 Read Me for Open Transport 1.1 (3/97)

Revised: 3/5/97
Security: Everyone

Remote Only 2.1 Read Me for Open Transport 1.1 (3/97)

=====

Article Created: 5 March 1997

TOPIC -----

This article is the Remote Only 2.1 ReadMe file for Open Transport 1.1.

DISCUSSION -----

Introduction

Remote Only 2.1 is an extension that allows you to turn on AppleTalk networking when both the printer port and the modem port on your computer are already in use (for example, for a serial printer and a modem). Without this extension installed, you cannot use an application that requires AppleTalk to be active at the same time your computer is connected to a modem and a serial printer.

For example, if your computer has two serial ports and you use one for a modem and the other for a StyleWriter printer, Remote Only allows you to use an application such as NetPresenz (which requires AppleTalk) without disconnecting either the modem or the printer.

The Remote Only extension is compatible with both "classic" AppleTalk software (the Network control panel) and Open Transport software (the AppleTalk control panel). If you use classic networking, Remote Only appears as an icon in the Network control panel. If you use Open Transport, Remote Only appears in the "Connect via" pop-up menu in the AppleTalk control panel.

Installing Remote Only

To install Remote Only, follow these steps:

1. Drag the Remote Only icon to the System Folder icon on your startup disk (not the open System Folder window). A dialog box appears asking if you want to move Remote Only to the Extensions folder.
2. Click OK. Remote Only is placed in the Extensions folder inside your

System Folder.

3. Choose Restart from the Special menu. When your computer starts up again, Remote Only is installed.

Activating Remote Only in the Network control panel

To activate Remote Only if you use classic AppleTalk software (the Network control panel), follow these steps:

1. Open the Network control panel.
2. Click the Remote Only icon.
3. Close the Network control panel. You can now turn on AppleTalk in the Chooser while using your computer's serial ports for other functions.

Activating Remote Only in the AppleTalk control panel

To activate Remote Only if you use Open Transport (the AppleTalk control panel), follow these steps:

1. Open the AppleTalk control panel.
2. Choose Remote Only from the "Connect via" pop-up menu.
3. Close the AppleTalk control panel.
4. In the dialog box that appears, click OK to save the change you made. You can now turn on AppleTalk while using your computer's serial ports for other functions.

TCP/IP Options Control Panel Read Me (3/97)

Revised: 3/5/97
Security: Everyone

TCP/IP Options Control Panel Read Me (3/97)

Article Created: 5 March 1997

TOPIC -----

This article is the TCP/IP Options Control Panel ReadMe file.

DISCUSSION -----

TCP/IP Options Control Panel Read Me

IMPORTANT: Do not use the TCP/IP Options control panel (previously called TCP/IP Path Discovery Control control panel) unless instructed to do so by your network administrator. TCP/IP Options is an unsupported utility developed by Apple Computer, Inc. It allows you to modify Open Transport/TCP's default behavior to disable the "Path MTU Discovery" feature and provide compatibility with certain third-party applications. (The one most commonly encountered is ATEX's MacText, a software terminal emulator for the ATEX/SysDeco Standard/Advanced Display Terminal.) Future releases of Open Transport (version 1.5 and later) will automatically disable Path MTU Discovery when appropriate. When you upgrade to Open Transport 1.5 or later, be sure to delete the TCP/IP Options control panel.

About the Path MTU Discovery Feature

Path MTU Discovery is an Internet standard implemented and automatically enabled in Open Transport/TCP. (This standard is not implemented in MacTCP.) Here's how it works:

- Unless a packet size is larger than the MTU for a network, Open Transport/TCP sets the "don't fragment" bit in an IP datagram header on transmission.
- When presented with a "don't fragment" packet that cannot be forwarded without fragmentation with the MTU size, intermediate routers send back an "ICMP can't fragment" error (required by current RFCs).
- When an "ICMP can't fragment" error is sent back, Open Transport/TCP moves to

the next smaller MTU size for that path, sets the "don't fragment" bit, and re-sends the packet. This process automatically results in using the largest supported MTU size for off-subnet traffic.

The standards document that describes Path MTU Discovery is available on the Internet at <http://ds.internic.net/rfc/rfc1191.txt>.

Why disable the Path MTU Discovery feature?

Path MTU Discovery works by sending datagrams with the "don't fragment" bit set. Some older routers don't handle this bit properly. Disabling Path MTU Discovery prevents the use of the "don't fragment" bit and may allow connections through older routers.

The TCP/IP Options control panel lets you disable the Path MTU Discovery feature to support older network routers which don't return the "ICMP can't fragment" error. Disabling the feature provides the same behavior as MacTCP. (Note that disabling the feature may introduce a performance penalty in some network configurations.)

WARNING: Misuse of the TCP/IP Options control panel may prevent Open Transport TCP/IP from operating properly.

Disabling the Path MTU Discovery feature

To install and use the TCP/IP Options control panel, follow these steps:

1. Drop the TCP/IP Options control panel onto a closed System Folder.
2. Open the Control Panels folder from the Apple menu.
3. Open the TCP/IP Options control panel.
4. To disable the path discovery feature to support older routers, click the "Disable IP path MTU discovery" checkbox to put a check in it.
5. Close the TCP/IP Options control panel.
6. Reboot your system in order for your setting to take effect.

Re-enabling the Path MTU Discovery feature

To revert to the normal Open Transport TCP/IP mode, uncheck the "Disable IP path MTU discovery" check box in the control panel and reboot your system.

WARNING: Simply removing the control panel from your Control Panels folder does not re-enable the IP path MTU discovery feature. You must uncheck the "Disable IP path MTU discovery" checkbox in the control panel.

Macintosh Performa 6400, 6360: Why Apple Video Player? (3/97)

Revised: 3/5/97
Security: Everyone

Macintosh Performa 6400, 6360: Why Apple Video Player? (3/97)

=====

Article Created: 5 March 1997

TOPIC -----

I have a Macintosh Performa 6360 or 6400 series computer. There is an application available under my Apple menu named Apple Video Player. When I select it, it indicates that the necessary video hardware is missing. Should I have gotten something else with my computer?

DISCUSSION -----

No. The Apple Video Player software is provided so as to easily support the Apple Video System, Apple TV/Video System, or Apple TV/FM Radio System (which requires the Apple Video System). These are available as options that can be added to your computer system.

If the computer you are using does not have the necessary hardware installed, Apple Video Player software will present the error message you described.

You may get a similar error message if you add the Apple TV Tuner card or Apple TV/FM Radio System without having the Apple Video System card properly installed.

PC Setup Unimplemented Trap, Error Message (3/97)

Revised: 3/5/97
Security: Everyone

PC Setup Unimplemented Trap, Error Message (3/97)

=====

Article Created: 5 March 1997

TOPIC -----

After installing Mac OS 7.6 and PC Compatibility 1.5 software, everything was working fine. However, after installing Open Transport PPP 1.0 and restarting my computer, I get this error message, "Sorry, a System Error Occurred. PC Setup, Unimplemented Trap." What is wrong?

DISCUSSION -----

During the installation process, the PC Setup preferences file was corrupted. To resolve this, you need to throw the PC Setup preferences file in the Trash, empty it, and restart your computer. A new PC Setup preferences file will be created with default settings.

PowerMac 180MHz Processor Upgrade Card: Models Supported (3/97)

Revised: 3/5/97
Security: Everyone

PowerMac 180MHz Processor Upgrade Card: Models Supported (3/97)

=====

Article Created: 5 March 1997

TOPIC -----

I have seen references made that the Power Macintosh 180MHz Processor Upgrade Card (M5458LL/A) is only supported in Power Macintosh 8500 series computers. Is this correct?

DISCUSSION -----

No. Some of the initial information incorrectly stated that the 180MHz Processor Upgrade Card was for "Power Macintosh 8500 series." However, the Power Macintosh 180MHz Processor Upgrade Card (M5458LL/A) is supported in the Power Macintosh 7500, 7600, 8500 and 9500 series.

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

LaserWriter 8.x: Apple Printers Paper Tray Options (3/97)

Revised: 3/5/97
Security: Everyone

LaserWriter 8.x: Apple Printers Paper Tray Options (3/97)

=====

Article Created: 5 March 1997

TOPIC -----

I do not understand all the paper tray options I have using the LaserWriter 8.x printer driver. Could you explain these.

DISCUSSION -----

This article provides an outline of paper tray usage with the LaserWriter 8.x printer driver and Apple LaserWriter printers. There are many possible settings, all of which are interdependent, so paper tray behavior is not as straightforward as it appears. Most of the examples given are with the LaserWriter Pro 630 or LaserWriter 16/600 PS printers since they have the most paper tray options. With respect to localized printers and/or drivers, you would substitute references to the "Letter" page size in this article with your country's default such as "A4".

- PAGE SETUP - To use a specific paper tray, the paper size selected in Page Setup must match the paper size in the tray you want to use.

Note:

The only way to change the paper size for the Multipurpose tray is through the Apple Printer Utility. The paper sizes for other trays are either set automatically (such as specific Letter size cassette), or by setting paper guides within the tray.

- MANUAL SELECTION - If you choose a specific paper source in the Print dialog, such as Cassette (500 Sheets), that specific tray is used -- given that the above condition on PAGE SETUP has been met.

- AUTO SELECT - If Auto Select is chosen (as the Paper Source in the Print dialog), you are NOT GUARANTEED that your print job will print from any specific paper tray (except with use of the "Installed and Preferred" option outlined below). You are telling the driver to print your job on any paper tray that has

the same page size as you've selected in Page Setup. Usually, Auto Select prints your job from the 250 sheet cassette. Here is the typical order of paper tray priority when Auto Select is chosen as the Paper Source:

1. Cassette (250 Sheets)
2. Multipurpose Tray
3. Cassette (500 Sheets)
4. Envelope Feeder

- **INSTALLED AND PREFERRED** - If "Installed and Preferred" is chosen for the 500 sheet cassette (in the Chooser-Setup-Configure dialog), this makes the 500 sheet cassette the very first paper tray choice. Auto Select **MUST** be chosen as the Paper Source in the Print dialog for this to work. The typical order of paper tray priority changes to:

1. Cassette (500 Sheets)
2. Cassette (250 Sheets)
3. Multipurpose Tray
4. Envelope Feeder

This **ONLY** affects the computer that the change is made on. There is no way to make the change affect all computers that print to the printer, except for:

- Changing every computer to have the "Installed and Preferred" setting,

or

- Downloading PostScript code to the printer (as outlined below).

- **AUTOMATIC TRAY SWITCHING** - When Automatic Tray Switching is enabled, the paper source switches automatically to another tray with the same paper size if the paper source you selected in the Print dialog runs out of paper. The typical order of paper tray priority for Automatic Tray Switching will follow the priority list in either **AUTO SELECT** or **INSTALLED AND PREFERRED** above.

Prior to LaserWriter driver 8.4, Automatic Tray Switching was enabled by simply switching it ON using the LaserWriter Utility or the Apple Printer Utility. Starting with LaserWriter 8.4, an extra step is now required: You also need to select the "Error Handling" pane in the Print dialog and click on "Switch to another cassette with same paper size."

- **POSTSCRIPT** - There are PostScript code fragments in the TIL that when downloaded, allow you to manually set a "default" paper tray. That paper tray is used if Auto Select is chosen as the Paper Source in the Print dialog. It is **STRONGLY ADVISED NOT** to use this method unless absolutely necessary, as it may confuse others using the printer.

There have been many unnecessary and costly service calls to customers thinking that their printer was defective when the problem was merely the default paper tray had been changed. A very good example of this is changing the default tray to the Multipurpose Tray. If the tray has no paper, the paper out LED illuminates and unknowing users will check the 250 sheet cassette instead (since it's usually default). Seeing that there is paper in the 250 sheet cassette,

they report the printer as a malfunction.

- ENVELOPE FEEDER - If your LaserWriter has an envelope feeder, you must select an envelope page size in Page Setup AND have "Envelope Feeder" chosen as the paper source in the Print dialog. If both of these conditions are NOT met, then paper will be pulled from the default paper tray (such as the Cassette (250 Sheets)).

NOTE:

There is an issue with the LaserWriter 16/600 PS that even without having an envelope page size selected in Page Setup, "Envelope Feeder" can be chosen as a paper source.

Avid Cinema: Static at Bottom of Screen (3/97)

Revised: 3/6/97
Security: Everyone

Avid Cinema: Static at Bottom of Screen (3/97)

=====

Article Created: 6 March 1997

TOPIC -----

I have seen a single line of static at the bottom of videos created using Avid Cinema, and sometimes I may see a vertical line of static on the left side of the image. Do you have any information on why this is happening?

DISCUSSION -----

Anomalies, noise, or static in digitized video can be caused by any of the following:

- Video head noise from a VHS player
- Faulty or low-quality cables
- Faulty digitizing hardware

When digitizing from VHS, you will almost always see some noise at the bottom of the video window. This noise originates on the tape. It is not visible on a television screen because TV screens crop the very bottom and top of the picture. Other video editing programs such as Premier will crop this area as well, although we believe you can set the application to not crop at all.

With Avid Cinema, the picture is never cropped so the noise is always visible. However, the noise will not be apparent if the video is printed back out to tape -- the noise is hidden by the way the TV crops the image. The noise will remain if the final product is a QuickTime movie. The image is not clipped before output to QuickTime.

Workgroup Server 9150/120: Drive Setup Compatibility (3/97)

Revised: 3/7/97
Security: Everyone

Workgroup Server 9150/120: Drive Setup Compatibility (3/97)

=====

Article Created: 7 March 1997

TOPIC -----

I have a Workgroup Server 9150/120. The version of Drive Setup (1.2.2) that comes with System 7.6 gives an error message "Cannot be used with this Macintosh" when trying to launch the Drive Setup.

I used version 1.0.5 of Drive Setup and everything worked fine. What's happening?

DISCUSSION -----

Apple Engineering has been notified of this situation. They will work toward a solution, possibly in a future release of Drive Setup. In the meantime, version 1.0.5 of Drive Setup is the accepted alternative.

PowerBook 1400 Series: Maximum RAM Allowed (3/97)

Revised: 3/7/97
Security: Everyone

PowerBook 1400 Series: Maximum RAM Allowed (3/97)

=====

Article Created: 7 March 1997

TOPIC -----

I have a PowerBook 1400 with 40 megabytes of memory and would like to add more memory to it. I would like to add another 32 megabytes, bringing the total memory up to 72 megabytes.

The technical specifications state that the PowerBook 1400 supports a maximum of 64 megabytes of memory. Will there be any adverse effect if I attempt an upgrade to 72 megabytes?

DISCUSSION -----

The maximum amount of total memory supported by Apple in the PowerBook 1400 is 64Mb. Individual cards may contain up to a maximum of 48Mb of DRAM.

Any combination of RAM, including the DRAM soldered to the main logic board (8Mb), the DRAM installed by Apple in the Apple factory slot (4Mb or 8Mb), and User installable RAM cards must not exceed a total of 64Mb of RAM.

Using combinations of RAM that go over the specified 64Mb limit is not supported by Apple Computer and may result in random errors.

Mac OS 7.6: IDE Drives and Internal HD Format (3/97)

Revised: 4/21/97
Security: Everyone

Mac OS 7.6: IDE Drives and Internal HD Format (3/97)

=====

Article Created: 7 Mar 1997

TOPIC -----

While running the Mac OS 7.6 Installer a message appears saying the application is unable to update the driver because the drive is not partitioned -- "This media is not partitioned, unable to update the driver." What's happening?

DISCUSSION -----

This happens only when the drive has been formatted with the Internal HD Format program included on 580 Series, 630 Series, 5200 Series, and 6200 series computers. (For a list of computers with IDE drives, see the article titled "Macintosh Desktop & PowerBook Computers: IDE Hard Drive" in the Tech Info Library.)

The solution is to back up the hard drive and reinitialize (low level format) it with Drive Setup 1.2.2. Drive Setup 1.2.2 is located on the Mac OS 7.6 CD-ROM in the Utilities folder. Note that reinitializing will result in the loss of all information on the hard drive, so performing the backup operation is critical.

Apple Media Tool 2.x: Creating Custom Palettes (3/97)

Revised: 3/10/97
Security: Everyone

Apple Media Tool 2.x: Creating Custom Palettes (3/97)

=====

Article Created: 10 March 1997

TOPIC -----

I would like to use a custom palette in Apple Media Tool (AMT) 2.x so that my 256-color images look their best. I know that AMT supports custom palettes, but I cannot seem to get them to work. How do you create custom palettes?

DISCUSSION -----

In AMT 2.x, each screen could have a custom palette. Apple Media Tool uses the palette of the media object that is the farthest back position on the screen. This is the first item in the list in the objects miniwindow.

Here are the steps to creating a custom palette:

Step 1

Create your media object with custom palette in the graphics application of your choice.

Step 2

Place a media object with the custom palette in the farthest back position. If your image needs to be in the foreground, create another object with the same palette, and place it in the farthest position. You can set the dimensions of this object to "0,0" if you do not want the object visible.

Step 3

Select the option "use custom palettes" in Runtime Setup Preferences.

Custom palettes are only used when the application is saved as a runtime object, and not as an Apple Media Tool project.

Performa 6360/6400: PhotoDeluxe User Guide Error (3/97)

=====

Article Created: 10 March 1997

TOPIC -----

This article discusses an error in the Adobe PhotoDeluxe User's Guide.

DISCUSSION -----

The Adobe PhotoDeluxe User's Guide pages 8-9 refers to a number of items which should be on the PhotoDeluxe CD, but are missing.

These include:

- * The trial version of DiAMAR Interactive's Better Photography
- * Berkeley System's After Dark
- * MetaTool's Special Effects.
- * Acrobat Reader

Where can these items be located?

Acrobat Reader is pre-installed on the computer's hard disk. The other items have not been licensed for inclusion with the PhotoDeluxe software included with the Performa 6360/6400 computer.

They are included with the PhotoDeluxe bundle sold by Adobe or they can be purchased separately from their respective manufacturers.

Hangul Jojung Control Panel: What Does It Do? (3/97)

Revised: 3/10/97
Security: Everyone

Hangul Jojung Control Panel: What Does It Do? (3/97)

Article Created: 10 Mar 1997

TOPIC -----

What does the Hangul Jojung control panel do?

DISCUSSION -----

Here is an explanation of what can be done with the Hangul Jojung control panel.
There are 2 options on the control panel:

1) Delete key - This gives users the option of forcing non-WorldScript savvy applications that attempt to delete 2-byte text one byte at a time to delete text 2 bytes at a time. At first glance, this may appear to conflict with the Delete by Jamo option in the Power Input Method (PIM). The PIM option is for text being processed by the input method before it is passed to an application. The Hangul Jojung control panel setting is the opposite. It is for text already entered into a document. The Hangul Jojung control panel simply forces an application to receive one or two Deletes every time the user types one Delete. The only time this is really needed is when using Asian languages in applications which aren't WorldScript II savvy.

2) 1 or 2 byte PostScript printing. Users of printer-resident 2-byte Korean PostScript fonts need to set this option in order to embed PostScript data in PostScript files. It affects users who have printer-resident fonts that are genuine two-byte encoded. (Without the Hangul Jojung control panel, printing is done assuming one-byte fonts.) Users who have this problem will immediately see a performance increase when the Hangul Jojung control panel is installed. Users with no PostScript fonts, just Apple's TrueType fonts included in the Korean, Japanese and Chinese language kits should receive no benefit nor side effects from having the Hangul Jojung control panel installed.

PC Compatibility Card: Serial Port Speed (3/97)

Revised: 3/12/97
Security: Everyone

PC Compatibility Card: Serial Port Speed (3/97)

Article Created: 10 March 1997
Article Reviewed/Updated: 12 March 1997

TOPIC -----

I have a PC Compatibility Card and want to know what the maximum speed of the serial port is.

DISCUSSION -----

All the PCI-Based PC Compatibility Cards are limited to 19,200 bps serial port speeds when using MS-DOS or Windows. However, testing has shown that 9600 bps is the maximum speed you should expect while maintaining the most reliable connection.

This limitation is the result of the UARTS used, lack of hardware handshaking in the PC environment, and other design factors.

In the Mac OS you do not have these same limitations.

Article Change History:
12 Mar 1997 - Added reliable connection information.

Apple QuickTake 200: Read Me Document (3/97)

Revised: 3/10/97
Security: Everyone

Apple QuickTake 200: Read Me Document (3/97)

=====

Article Created: 10 March 1997

TOPIC -----

This article contains the Apple QuickTake 200 Readme Document.

DISCUSSION -----

About the QuickTake 200 Software

This file includes important information about using your QuickTake 200 camera and the Camera Access software. Because this information is not included in the documentation accompanying the product, you may want to print it. To do so, choose Print from the File menu.

Installing the Software

Install the Apple QuickTake 200 software before installing PictureWorks NetCard, Adobe PhotoDeluxe, or Adobe PageMill.

Using Video-in

- Your computer must be compatible with Apple Video Player to use the Camera Access Video-in function. Some CPUs require specific settings. Check your computer user's manual.
- If you have a hardware play-thru video system (for example, Power Macintosh 6100 AV, 7100 AV, or 8100 AV or Macintosh LC 630), video play-thru cannot be turned off via "Video Playthru Off During Record" in the Video-In menu.

Recording a Movie or Video

- When recording with compression, you might need to hold down the mouse button longer to stop the recording process. (In most instances, a click will stop the process.)

- Sound is not supported.

Editing Movie Files

When copying and pasting a movie frame into another movie within the Camera Access software, do not resize the source movie frame. (Resizing will distort the images.)

PowerBook 500 Series

- Set the PowerBook Setup in the Control Panel to NORMAL and then launch Camera Access.

NOTE:

In the Read Me document that ships with the QuickTake 200, it states the control panel should be set to Compatible. That information is incorrect. This article has been updated with the correct information.

- Don't use the Sleep command or close the PowerBook cover while the camera is connected to the Powerbook. This will cause your system to freeze.

Using the QuickTake Plug-ins

- To use the Apple QuickTake 200 plug-in with PhotoDeluxe, drag a copy of the plug-in from the Goodies folder to the Plug-ins folder of the PhotoDeluxe application.
- The QuickTake 200 plug-in is compatible with Photoshop 3.0 and later; it is not compatible with PhotoFlash.
- You can open only one thumbnail at a time. (Even when multiple thumbnails are selected, only the first one will open.)

Closing the QuickTake 200 Panel

When your camera is not connected to your computer, close the QuickTake 200 panel. Leaving it open will slow down your mouse response.

Creating Floppy Disks From the CD-ROM

1. Open the "QuickTake 200 disk image" folder.
2. Click the Disk Copy icon.
3. Click the "Make a Floppy" button.
4. Select QuickTake 200 Software.image.

A message appears: "Please insert a floppy disk."The disk is erased and reformatted, and the QuickTake software is copied onto the disk. A second message appears: "Build floppy operation completed successfully."

5. Click Quit.

Your floppy disk can now be used to install the software.

IMPORTANT Don't drag the file onto the Disk Copy icon. You must follow the above procedure.

AppleTalk

It is recommended that you turn off AppleTalk when using a 68K CPU. (Open the Chooser and turn off AppleTalk.)

Using Open Transport

It is recommended that you use the Modem port for Camera connection when configuring the port using OpenTransport.

Performa 6420 AV

When using Avid Cinema Extension, you should set the Monitor control panel to 32,000 colors (16 bits). Turn off the Avid Cinema Extension when you set to 256 colors.

Printing and Downloading Camera Images Simultaneously

There is a conflict in communication when trying to print and open an image from the camera at the same time in a 68K machine. If this problem occurs, please wait until printing is complete, then try opening the image again.

TIFF File Format

Camera Access does not support compressed TIFF files.

Power-Off Problem

On extremely rare occasions, the QuickTake 200 camera might not power off. If this happens, disconnect the camera from the optional AC power adapter. Open the battery door to reset the camera.

Technical Support for Adobe PhotoDeluxe and Adobe PageMill

- For Adobe PhotoDeluxe support, call 206-628-5726.
- For Adobe PageMill support, call 206-628-5731.

PowerBook 3400: Video Out Specifications (3/97)

Revised: 3/18/97
Security: Everyone

PowerBook 3400: Video Out Specifications (3/97)

Article Created: 10 March 1997
Article Reviewed/Updated: 17 March 1997

TOPIC -----

This article describes the PowerBook 3400 built-in video out specifications.

DISCUSSION -----

The PowerBook 3400 computer has a 16-bit video out VGA connector built into the backplane for an external video monitor. The connector is standard DB9/15 for use with VGA or SVGA monitors.

You can connect a VGA or SVGA monitor all the way up to a 21" monitor with 1024 x 768 resolution projected in 256 colors (8-bit). Video projection devices can also be attached via the VGA connector.

Video Adapter

An optional video adapter allows the user to connect a standard Apple video cable to the computer. The adapter is similar to another video adapter used with older Macintosh PowerBooks. The adapter is granite colored and enables the PowerBook 3400 computer to recognize a wider range of monitor types. The Apple part number for the new adapter is 590-0289-A.

Video Ram

The PowerBook 3400 ships with 1MB of VRAM which enables it to support up to 16 bits per pixel on most monitors, and up to 8 bits per pixel on larger monitors.

NOTE: The video ram (VRAM) is not upgradeable.

Colors Supported

16 bit (thousands) at 640x480
16 bit (thousands) at 800x600

8 bit (256) at 832x624
8 bit (256) at 1024x768

Video Mirroring

There is no video mirroring control panel/strip. If the external monitor can display 800 by 600 pixels at 60 Hz, the PowerBook 3400 computer can display simultaneously on both the external monitor and the flat panel display. This mode of display, called Simulscan, provides the same information on both displays.

Examples: When connected to a 17" Multiscan monitor:

640x480 67Hz - Thousands of colors (external monitor available only)
800x600 60Hz - Thousands of colors (Simulscan "Mirroring")
800x600 75Hz - Thousands of colors (external monitor available only)
832x624 75Hz - 256 colors (external monitor available only)
1024x768 70Hz - 256 colors (external monitor available only)

Begin_Table

Monitor Pixel Depths

The following table lists the pixel depths supported for each type of monitor.

Monitor type	Resolution	Bits per pixel
-----	-----	-----
12-inch color	512 by 384	1, 4, 8, 16, 24
12-inch monochrome	640 by 480	1, 4, 8
13-inch and 14-inch color	640 by 480	1, 4, 8, 16
VGA and SVGA	640 by 480*	1, 4, 8, 16
SVGA	800 by 600	1, 4, 8, 16
SVGA	1024 by 768	1, 4, 8
Full-page monochrome	640 by 870	1, 4, 8
Full-page color	640 by 870	1, 4, 8
16-inch color	832 by 624	1, 4, 8
Apple 15-inch multiple scan	640 by 480	1, 4, 8, 16
Apple 15-inch multiple scan	800 by 600*	1, 4, 8, 16
Apple 15-inch multiple scan	832 by 624	1, 4, 8
Apple 17-inch multiple scan	640 by 480	1, 4, 8, 16
Apple 17-inch multiple scan	800 by 600*	1, 4, 8, 16
Apple 17-inch multiple scan	832 by 624	1, 4, 8
Apple 17-inch multiple scan	1024 by 768	1, 4, 8
Apple 20-inch multiple scan	640 by 480	1, 4, 8, 16
Apple 20-inch multiple scan	800 by 600*	1, 4, 8, 16
Apple 20-inch multiple scan	832 by 624	1, 4, 8
Apple 20-inch multiple scan	1024 by 768	1, 4, 8
NTSC TV monitor	512 by 384*	1, 4, 8, 16, 24
NTSC TV monitor	640 by 480	1, 4, 8, 16
PAL TV monitor	640 by 480*	16 only
PAL TV monitor	768 by 576	1, 4, 8, 16

End_Table

Notes:

- 1) The computer does not provide a display with 2 bits per pixel.
- 2) An asterisk (*) indicates the startup resolution. Other resolutions can be selected using the Monitors control panel or the control strip.
- 3) For multiple scan monitors, The table indicates the default resolution with an asterisk. For example, when first connected to the computer, an SVGA monitor's display resolution will be 640 by 480 pixels. The user can switch to a higher resolution by using the Monitors control panel or the control strip. The resolution set by the user will be used the next time the computer is started up.
- 4) When connected to a non-multiscan monitor you will only get the external monitor at the set resolution.

Example: Apple 16" monitor 832 by 624 75Hz - 256 colors

PowerBook 3400: Battery Recondition Software (3/97)

Revised: 3/10/97
Security: Everyone

PowerBook 3400: Battery Recondition Software (3/97)

=====

Article Created: 10 March 1997

TOPIC -----

Why does the PowerBook 3400 ship with the Battery Recondition software when the Lithium Ion battery does not require reconditioning?

DISCUSSION -----

The Battery Recondition software is included because the PowerBook 3400 can use a PowerBook 5300 or 190 Nickel Metal Hydride battery, which does require occasional reconditioning.

When a customer tries to use the Battery Recondition software on a PowerBook 3400 containing a Lithium Ion battery, the customer will get a message stating that it is not necessary.

PowerBook 1400: 1400 Demo Processor speed (3/97)

Revised: 3/10/97
Security: Everyone

PowerBook 1400: 1400 Demo Processor speed (3/97)

=====

Article Created: 10 March 1997

TOPIC -----

I just purchased a Powerbook 1400/133mHz. When I run the "PowerBook 1400 Demo" from my hard drive and click on "SPECS", it states I have a 117mHz processor? Have I been given the wrong unit?

DISCUSSION -----

The "PowerBook 1400 Demo" is merely an interactive presentation to show the features of the 1400. It is not intended to be a diagnostic tool or system profiler. Most likely, the presentation was written before the 133 mHz processors were part of the 1400 product line.

To confirm the speed of your processor, you may run Apple System Profiler, available with Mac OS 7.6 or online at Apple Software Updates.

Apple TV/FM Radio System Requires Video-In Card (3/97)

Revised: 3/11/97
Security: Everyone

Apple TV/FM Radio System Requires Video-In Card (3/97)

=====

Article Created: 11 March 1997

TOPIC -----

I just installed an Apple TV/FM Radio System, but I keep getting a message saying it is not installed. I checked it over and I'm sure I installed it correctly. What could be wrong?

DISCUSSION -----

The Apple TV/FM Radio System (M4586LL/A) requires a Macintosh Performa or Power Macintosh computer with a video-in card. The video-in card is required even if only the FM Radio Player is used. If the video-in card is not installed, the FM Radio Player will display an error message saying, "The FM radio is not installed in this Macintosh."

While some Macintosh Performa and Power Macintosh computers come with a video-in card pre-installed (for example, the Power Macintosh 5400/120) most of these computers require the purchase of the Apple Video System (M2894LL/D or later).

Troubleshooting Hard Drives: When To Reformat (3/97)

Revised: 4/21/97
Security: Everyone

Troubleshooting Hard Drives: When To Reformat (3/97)

Article Created: 11 March 1997

TOPIC -----

While troubleshooting a hard drive problem, when might it be necessary to reformat (initialize) a hard drive?

DISCUSSION -----

Reformatting a hard drive (also called "initializing") is only necessary when a disk utility, such as Disk First Aid, finds a problem that it is not able to repair. Formatting is also required when partitioning a hard drive. Formatting a hard drive is not necessary while troubleshooting a software problem.

If hard drive failure is suspected, start the computer from the Disk Tools floppy disk or Apple Macintosh CD that came with the computer, and run the Disk First Aid program. If Disk First Aid does not find any problems, or finds problems that it is able to repair, there is no need to reformat the drive.

If Disk First Aid finds problems and says that it is not able to repair them, a third party disk repair utility may be able to repair the drive. If you do not have access to these utilities, or they are not able to repair the drive, then you should back up all of the files on the hard drive and reformat it.

Mac OS 7.6 & Macintosh TV Compatibility (3/97)

Revised: 3/11/97
Security: Everyone

Mac OS 7.6 & Macintosh TV Compatibility (3/97)

=====

Article Created: 11 March 1997

TOPIC -----

I just updated my Macintosh TV from System 7.5.5 to Mac OS 7.6, and now the TV Setup control panel does not work. I did a clean install of Mac OS 7.6 and also selected the Mac OS 7.6 Base extension set in Extensions Manager. I am using version 1.0.2 of the TV Setup control panel. I can open the control panel, but if I try to select an option I get a Finder bus error. If I switch to the TV I get no video.

Is the Macintosh TV compatible with Mac OS 7.6?

DISCUSSION -----

Mac OS 7.6 installs the Apple Video Player application and the Video Startup extension. The Video Startup extension is not compatible with the TV Setup control panel used to control the TV functions on the Macintosh TV. Either deselect the Video Startup extension in the Extensions Manager control panel, or drag Video Startup from the Extensions folder to the Trash.

The Macintosh TV does not need the Apple Video Player or Video Startup extension. The Apple Video Player may also be dragged to the Trash from the Apple Extras folder.

Configuring TCP/IP on an Apple Network Server (3/97)

Revised: 3/11/97
Security: Everyone

Configuring TCP/IP on an Apple Network Server (3/97)

=====

Article Created: 11 March 1997

TOPIC -----

This article describes configuring TCP/IP on an Apple Network Server running AIX.

DISCUSSION -----

The recommended time to configure TCP/IP on system running AIX is during initial software installation with Install Assist. However, if TCP/IP needs to be configured later, the following steps can be followed:

Step 1

Logout of the AIX Desktop (CDE).

Step 2

Use the Options button at the AIX login window to begin a command line login. Be sure to hit the enter or return key so that you receive a login prompt.

Step 3

Login as root.

Step 4

Execute the following command to open the TCP/IP configuration window:

```
smit tcpip
```

Step 5

Press the Enter or Return key to select Minimum Configuration & Startup.

Step 6

Select the interface to be configured (commonly en0).

Step 7

Complete the TCP/IP configuration by completing the Entry Fields. Use arrow keys to move between fields. Once the entry fields are complete, press Enter or Return.

NOTE: Do not set START now to "yes".

Step 8

Press the F10 key to exit TCP/IP configuration.

Step 9

Check the contents of the '/etc/hosts' file by entering the following command:

```
more /etc/hosts
```

The end of the file should have a line for loopback exactly as follows:

```
127.0.0.1      localhost      loopback      # loopback lo0 name/address
```

It should also have an entry for your hostname similar to this:

```
192.14.4.16    spoetzl    <----your hostname; should contain one entry
```

If either of these lines are incorrect, the '/etc/hosts' file needs to be edited using vi to correct it before proceeding.

Step 10

Shutdown and reboot the server by entering the following command:

```
shutdown -Fr
```

Mac OS 7.6: System Requirements (3/97)

Revised: 3/11/97
Security: Everyone

Mac OS 7.6: System Requirements (3/97)

Article Created: 11 March 1997

TOPIC -----

What are the system requirements for installing Mac OS 7.6?

DISCUSSION -----

The following computers can install Mac OS 7.6:

- Computers with PowerPC microprocessors
- Computers with 68040 microprocessors
- Computers with "32-bit clean" 68030 microprocessors. All computers with 68030 microprocessors are 32-bit clean except the Macintosh SE/30, Macintosh IIX, and the Macintosh IICx.

In addition, to install Mac OS 7.6, a computer must have at least 8 MB of RAM (random-access memory). If your computer has less than 16 MB of built-in RAM, you must use virtual memory. (Mac OS 7.6 automatically turns on virtual memory when you install it.)

To install the recommended software, you need about 70 MB of free space on your hard disk. To install all the optional components, you may need up to 120 MB of disk space; if you install just the minimum set of system software, you may only need 40 MB. The exact amount of space needed varies for different computer models and hard disk sizes.

AIX 4.1.4, 4.1.4.1, & 4.1.5: File size Limits (3/97)

Revised: 3/14/97
Security: Everyone

AIX 4.1.4, 4.1.4.1, & 4.1.5: File size Limits (3/97)

=====

Article Created: 12 March 1997
Article Reviewed/Updated: 14 March 1997

TOPIC -----

I'm interested in moving a database application from an RS-6000 to a Apple Network Server 700. One of my database files, however, is approaching (and will soon exceed) 2 GB in size.

My application support provider informs me that I will require AIX 4.2 or greater in order to handle a file of this size. Is this true or will AIX 4.1.4.X do the job? Is there a patch or do I have to wait to for AIX 4.2 release for the Apple Network Server 700?

DISCUSSION -----

The AIX 4.1.4, 4.1.4.1, and 4.1.5 file system data structure is based on the 32-bit addressing scheme, pointers, data blocks, and so on. Therefore 2 to the 31 power which is about 2 GB, is the maximum file size allowed.

AIX 4.2 will support 64 bit addressing, and at that time the maximum file size will greatly exceed the 2GB limit. In order to support file size over 2 GB, you need to wait for AIX 4.2.

The 'ulimit' command can be used to set or examine the resource limits including the file size. The example below, would set the maximum file size to 4,194,304 blocks (512 Bytes/block) which is 2GB, the limit:

```
ulimit -f 4194304
```

If you set ulimit -f to this value, the it will show "unlimited" which is the maximum. The default file size is set to 2,097,151 blocks (1 GB).

Newton OS 2.1: No Desktop connection Using IrDA (3/97)

Revised: 3/12/97
Security: Everyone

Newton OS 2.1: No Desktop connection Using IrDA (3/97)

=====

Article Created: 12 March 1997

TOPIC -----

The Dock application on the MessagePad 2000 and the eMate 300 list an option to connect to my desktop computer using IrDA. This is also mentioned in the MessagePad 2000 User's Manual (p.128) and the eMate User's Manual (p.160). How can I connect to my desktop unit using IrDA?

DISCUSSION -----

The IrDA option appears within the DOCK application on both the eMate 300 and MP2000. Although there is support in the Newton OS for IrDA connections, currently there is no support for this in the Newton Connection Utilities or any other connectivity application. Apple currently has no plans for implementing this feature into the Newton Connection Utilities.

PowerBook 3400 & Open Transport 1.1.2 Incompatibility (3/97)

Revised: 4/21/97
Security: Everyone

PowerBook 3400 & Open Transport 1.1.2 Incompatibility (3/97)

=====

Article Created: 12 March 1997

TOPIC -----

I installed Open Transport (OT) 1.1.2 on my PowerBook 3400 computer. All seemed well until the computer went into sleep mode and then it froze. I have been able to reproduce this several times. What is wrong?

DISCUSSION -----

There are some incompatibilities between Open Transport 1.1.2 and the PowerBook 3400 computer. We were able to reproduce freezing by repeatedly switching between IRTalk and Printer/Modem port in the AppleTalk control panel.

We suggest you reinstall Open Transport 1.1.1. There are no fixes in Open Transport 1.1.2 that apply to the PowerBook 3400 computer.

Apple MessagePad Devices: Power Adapter Compatibility (3/97)

Revised: 3/13/97
Security: Everyone

Apple MessagePad Devices: Power Adapter Compatibility (3/97)

=====

Article Created: 13 March 1997

TOPIC -----

The Apple MessagePad 2000 and the Apple eMate 300 ship with a different AC power adapter than previous MessagePad models. Are the original power adapters compatible with the MessagePad 2000 and the eMate 300? Are the new power adapters compatible with earlier MessagePad models?

DISCUSSION -----

The original Newton Power Adapter was designed for the original MessagePad, MessagePad 100, MessagePad 110, MessagePad 120, and MessagePad 130 models.

The Newton 9W Power Adapter was introduced with the Apple MessagePad 2000 and the Apple eMate 300 and is recommended for these models. The Newton 9W Power Adapter is included with the Apple eMate 300, and is offered as an option with the Apple MessagePad 2000.

The original power adapters are compatible with the Apple MessagePad 2000 and the Apple eMate 300. However, the Newton 9W Power Adapter that ships with the Apple MessagePad 2000 and eMate 300 are designed to provide a fast recharge (1-2 hours). The original Newton Power Adapter works on these models, but charges at a slower rate (2-3 hours).

The new power adapters are compatible with earlier MessagePad models. The Newton 9W Power Adapter that ships with the Apple MessagePad 2000 and Apple eMate 300 charges the previous Apple MessagePad models in half the original time.

Note:

The 9W Power Adapter does not reduce the recharge time in the Apple MessagePad 100, whose rechargeable battery recharges in the same amount of time with either adapter.

Macintosh On Microsoft NetBEUI/NetBIOS Networks (3/97)

Revised: 3/13/97
Security: Everyone

Macintosh On Microsoft NetBEUI/NetBIOS Networks (3/97)

=====

Article Created: 13 March 1997

TOPIC -----

Is there software available for my Macintosh that would allow it to participate in Microsoft NetBEUI/NetBIOS networks with file, print and message services?

DISCUSSION -----

Yes. Thursby Software Systems offers one such solution, named DAVE.

DAVE is a software solution that enables Apple Macintosh users to participate in Microsoft networks with file, print and message services. DAVE is installed directly on the Macintosh computer and provides Macintosh users the ability to mount shared directories on Windows NT (Server and Workstation), Windows 95 and Windows for Workgroups computers.

DAVE performs all communications using the industry standard protocol TCP/IP with a NetBIOS driver that is fully RFC 1001/1002 compliant and supports Windows Internet Name Server (WINS). All services are implemented using the Common Internet File System (CIFS) protocol. CIFS is an enhanced extension of the desktop cross-platform protocol for distributed file sharing called Server Message Block (SMB).

Utilizing CIFS and X/Open protocol standards, DAVE gives Macintosh users simultaneous read and write access to files stored on remote computers without first requiring users to download or copy the files to a local drive. Using the Chooser, users mount systems and browse for resources both in their own workgroup and in other workgroups. Mounting is very similar to AppleShare but uses no AppleTalk protocols.

DAVE negotiates dialects up to and including NT LM 0.12. It provides direct integration with Services for Macintosh and NTFS by using the same format for storing Apple resource and finder information on NT servers. By using DAVE with Remote Access Services (RAS), Macintosh users can access NT servers from remote dial-up locations, sharing files and accessing numerous applications over an

organization's intranet and the internet.

DAVE is implemented as a modular set of Macintosh drivers, extensions and applications that can be tailored to the needs of the individual Macintosh user. The NetBIOS driver can be configured using DHCP for simpler network management.

FILE AND PRINT SERVICES

DAVE provides the Macintosh user with the interface environment they are accustomed to. Downloading or copying files to a local drive is not necessary when running DAVE. Using the Macintosh Chooser, users can mount multiple shared directories on Windows NT, Windows 95 and Windows for Workgroups computers. Macintosh applications can then manipulate files directly over the network.

The print gateway works with PostScript print drivers and spools print jobs on Windows systems that are configured to share printers. Printers appear in the Macintosh user's Chooser window. The gateway supports Adobe compliant PPD configurations and handles PostScript query jobs that conform to Adobe document structuring conventions.

MESSAGE SERVICE

The Message Tool gives users the ability to compose and send messages. The Message Listener is an 'init' which loads at startup to receive messages. Message reception can be disabled and enabled by the user. The Message Listener is useful for notifying users of changes in server status and print job completion. NT administrators can use this service to broadcast messages to their users.

SECURITY

DAVE uses encrypted passwords and works with both LanManager and Windows NT passwords.

Begin_Table

DAVE FEATURES

- * Client file services
- * Client print services
- * Message Tool
 - o User controlled
 - o Pop-up message windows for the SMB messaging service
 - o Compose and send messages
- * Internet and intranet access
- * NetBIOS Driver
 - o Control Panel to configure and monitor operation of NetBIOS driver
 - o Fully RFC 1001/1002
 - o WINS compatible and configurable with DHCP
- * Supports 68K and PPC Macintosh, Mac OS 7.5.x
- * Supports at least 10 mounts
- * Supports FAT and NTFS file systems

- * Uses the Apple File System Manager
- * Supports aliases
- * Supports browsing for resources in Chooser
- * Integration with Services for Macintosh
- * Supports encrypted passwords
- * Provides Unicode names for Windows NT
- * Apple Open Transport Native
- * Compatible with MacTCP
- * Supports multiple remote printers
- * RAS support for mobile access via PPP
- * RAS connection only utilized when user accessing remote files

MACINTOSH SYSTEM REQUIREMENTS

- * Any Macintosh with a 68020 or higher processor
- * MacOS 7.5.x with a minimum of 8 megabytes of RAM
- * Apple's MacTCP or Open Transport TCP/IP
- * Any hardware required to run TCP/IP

MICROSOFT NETWORK REQUIREMENTS

- * At least one of the following systems
 - o Windows NT Server or Workstation V3.51 or later
 - o Windows 95
 - o Windows for Workgroups V3.11 with a Microsoft TCP/IP driver

End_Table

GeoPort Modem: Slowing It To 14.4 Kbps (3/97)

Revised: 3/13/97
Security: Everyone

GeoPort Modem: Slowing It To 14.4 Kbps (3/97)

=====

Article Created: 13 Mar 1997

TOPIC -----

I have a GeoPort modem, which I am attempting to use with Apple Telecom software version 3.1. I need to slow my modem to 14.4 Kbps. How do I do this?

DISCUSSION -----

Add the command ATSt110=1 to your initialization string. This will disable V.34 (28.8/33.6 Kbps) protocols and allow the modem to negotiate either V.32 (9600 baud) or V.32 bis (14.4 Kbps) protocols only.

AT Command Reference: Erratum (4/97)

Article Created: 13 March 1997
Article Reviewed/Updated: 1 April 1997

TOPIC -----

I have a copy of the AT Command Reference, which I downloaded from one of Apple's Software Update locations. I need to slow my GeoPort modem to 14.4 Kbps. I am confused by the presentation for the S110 register on page 17, which states the following:

S110 Modulation Selector

0 V32/V32bis enabled, V34/34 (33.6) disabled
1 V32/V32bis enabled, V34/34 (33.6) disabled
2 Full modulation set available
7 V34 (33.6) only enabled

The descriptions for the first two settings seem identical. Should they be?

DISCUSSION -----

There is an error in the documentation. The first two items should read:

0 V32 enabled, V32bis disabled, V34/34 (33.6) disabled
1 V32/V32bis enabled, V34/34 (33.6) disabled

To elaborate:

V32 = 9600 baud protocols
V32bis = 14.4 Kbps protocols
V.34 = 28.8 Kbps protocols. Recently, this standard was upgraded to include 33.6 Kbps protocols; Apple Telecom software version 3.1 or newer will support these protocols on Power Macintosh computers.

As an example, passing the command AT S110=0 to the modem will turn on 9600 baud only.

Passing the command AT\$110=1 will allow the modem to adjust speed to 9600 or 14.4 Kbps as necessary, and will turn off 28.8 or 33.6 Kbps performance.

These articles can help you locate the AT Command Reference document mentioned in this article:

PC Compatibility Card: Gets Multiple Resolutions In Win95 (3/97)

Revised: 3/19/97
Security: Everyone

PC Compatibility Card: Gets Multiple Resolutions In Win95 (3/97)

Article Created: 14 March 1997
Article Reviewed/Updated: 19 March 1997

TOPIC -----

I have a PCI-based Power Macintosh computer with a PC Compatibility Card and an Apple multiple scan monitor. I am running Windows 95 in the PC environment. I am able to get multiple video resolutions in the Macintosh environment, but in the PC environment, the only resolution available is 640x480. How do I get Windows 95 to do higher resolutions?

DISCUSSION -----

In order to get more than 640x480 resolution in Windows 95, you need to install the updated Windows 95 video driver software that comes with the PC Compatibility Card and select the proper display type for your monitor. Both of these changes are done in the Display control panel in Windows 95.

To install the updated video drivers for Windows 95:

- 1) Insert the PC Utilities CD into the CD-ROM drive
- 2) In Windows 95, open the Display control panel
- 3) Click on the tab labeled 'Settings'
- 4) Click on 'Change Display Type'. If the Adapter Type shows up as 'ATI mach64 (macxw4)(DirectDraw)', you have already installed the update driver and do not need to reinstall it. Skip to the section below about selecting your monitor type.
- 5) For 'Adapter Type', click on 'Change...'
- 6) Click on 'Have Disk...'
- 7) type in 'E:\video\win95'
- 8) Select 'ATI mach64 PCI (macxw4)(DirectDraw)' and click 'OK'

To select the proper display type for an Apple monitor:
<instructions are in 12" PC Compat Card manual, chapter 4, pp80-82>

Mac OS: Third-Party Software and Hardware Guide (3/97)

Revised: 3/14/97
Security: Everyone

Mac OS: Third-Party Software and Hardware Guide (3/97)

=====

Article Created: 14 March 1997

TOPIC -----

This article provides information on locating third-party hardware and software Mac OS-based computer products. Much of this information was formerly provided by Redgate Communications. Is there an alternative that provides a comprehensive listing of products than what is typically found in reseller catalogs?

DISCUSSION -----

Apple has the Mac OS Software & Hardware Guide web site on the Internet which features over twelve thousand third-party Macintosh products in one online location. The web site also contains information on purchasing specialized Mac OS software that cannot be purchased through standard sales channels, such as scientific and technical applications. Anyone can access the web site directly at:

<<http://www.macsoftware.apple.com/>>

This web site features a search engine which locates products by name, vendor, and/or keywords. It also has a link which lets vendors submit new product information, or update existing product information in a timely manner.

Revised: 3/14/97
Security: Everyone

A/UX and exportFS: Using With NFS (3/97)

=====

Article Created: 14 March 1997

TOPIC -----

I want to use exportFS to NFS mount a Macintosh directory for sharing data. The Macintosh directory has spaces in the name which export can use, and the \ and " characters are reserved for other operations in the /etc/exports file. How can I export this directory?

DISCUSSION -----

Create a symbolic link (ln -s) for that directory, called shared_data or equivalent name, that is one with no spaces. Then export the symbolic link instead of the original directory.

Dispatcher Software: Virtual Memory Issue (3/97)

Revised: 3/24/97
Security: Everyone

Dispatcher Software: Virtual Memory Issue (3/97)

Article Created: 15 March 1997
Article Reviewed/Updated: 19 March 1997

TOPIC -----

I have an Apple Color OneScanner attached to my Macintosh computer. I am encountering problems when using the Dispatcher software that came with the scanner. If virtual memory is turned on, Dispatcher will crash with a type 1 error as soon as I begin a prescan. If I turn virtual memory off, everything works OK. How can I use Dispatcher with virtual memory turned on?

DISCUSSION -----

The behavior you describe may also occur with HyperScan and Ofoto scanner software. Further, the behavior is not limited to the Apple Color OneScanner; it may occur with other Apple scanners as well. In all cases, the solution is the same.

There is a new version of the Scanner extension that addresses this issue. Its name is Dispatcher-Ofoto Drvr 4.2, and it has been posted to Apple Software Update locations. With the new extension, you will be able to use Dispatcher without having to turn off virtual memory.

The new extension may be used with the following scanner software:

- Dispatcher software version 2.0 (or newer)
- HyperScan
- Ofoto 2.0.1 (or newer).

These articles can help you locate the Scanner extension mentioned in this article:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.

- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

This article was published in the 24 March 1997 "Information Alley."

Article Change History:

24 Mar 1997 - Add Information Alley statement.

19 Mar 1997 - Added HyperScan, Ofoto and other scanners to discussion.

HyperCard 2.x: Using The Dial Command (3/97)

Revised: 3/19/97
Security: Everyone

HyperCard 2.x: Using The Dial Command (3/97)

=====

Article Created: 19 March 1997

TOPIC -----

I'm trying to use HyperCard 2.x's dial command to operate my modem, as described in the manual. I'm using the command:

dial "2551212" with modem "ATS0=0DT"

My GeoPort modem picks up and starts to dial, but then hangs up after 3 numbers. What's happening?

DISCUSSION -----

Starting with HyperCard 2.1, a new global property named "dialingTime" controls the amount of time the serial port will be kept open after a dial command. By default, this is set to 3 seconds. You can increase the time, as shown in the following sample script:

```
on mouseUp
    set the dialingTime to 600 -- (600 ticks = 10 seconds)
    dial "2551212" with modem "ATS0=0DT"
end mouseUp
```

For more information about the AT modem commands which can be used with your modem, consult your modem documentation.

CFM-68K Runtime Enabler 4.0: Final Version Read Me (3/97)

Revised: 3/19/97
Security: Everyone

CFM-68K Runtime Enabler 4.0: Final Version Read Me (3/97)

=====

Article Created: 19 March 1997

TOPIC -----

This article is the CFM-68K Runtime Enabler final version, "How to Install CFM-68K" Read Me file.

DISCUSSION -----

Update: CFM-68K Runtime Enabler final version now available for download!

Apple Computer has released version 4.0 of the CFM-68K Runtime Enabler extension. This extension fixes a problem with earlier versions of this extension which could result in application instability and loss of data. Because of the potential quality impact of this problem, Apple strongly recommends that customers with earlier versions of this extension upgrade to version 4.0.

To determine what version of the extension you have installed on your computer, perform the following steps:

- 1) Open your hard drive by double clicking it.
- 2) Open your System Folder by double clicking it.
- 3) Open you Extensions Folder by double clicking it.
- 4) Select the " CFM-68K Runtime Enabler" file. Note that this file begins with a space.
- 5) Choose Get Info from the File menu.
- 6) The version number is listed next to the Version heading.
- 7) If the version number is less than 4.0, you should replace the

extension with version 4.0, using the following directions.

(This is not part of the Read Me file. NOTE: If you are using CFM-68K Runtime Enabler 4.0b1 Beta software, you should replace the extension with version 4.0.)

- 8) Select the file ObjectSupportLib and Choose Get Info from the File menu.
- 9) If the version number of the file is less than 1.2, you need to replace it with the newer version.
- 10) Drag ObjectSupportLib and CFM-68K Runtime Enabler from your Extensions folder onto your Desktop. If you had previously removed the CFM-68K Runtime Enabler, then drag only ObjectSupportLib onto your Desktop. The ObjectSupportLib file must be out of your Extensions folder, but cannot be thrown away or replaced because it is in use. After you restart your computer, you can drag the ObjectSupportLib file from the Desktop to the Trash.
- 11) Locate the folder "CFM-68K 4.0 folder" and double-click it to open it.
- 12) Drag the two files " CFM-68K Runtime Enabler" (note this begins with a space), and "ObjectSupportLib" into the Extensions folder in your System Folder. Important: Dragging these files onto the System Folder itself may not route them to the correct location. Both need to be in the Extensions folder.
- 13) Restart your computer.
- 14) Verify that you have the correct versions installed by repeating steps 1 through 9.
- 15) Drag the older versions of the files from your desktop to the Trash.

MessagePad Devices: Cables needed for Windows Connections (3/97)

Revised: 3/21/97
Security: Everyone

MessagePad Devices: Cables needed for Windows Connections (3/97)

=====

Article Created: 20 March 1997

TOPIC -----

I need to know how I can obtain a cable for my Apple MessagePad, so I can use it with my Windows computer.

DISCUSSION -----

Newton software only supports serial connections, so depending on the type of serial port on your Windows PC, you these cables:

DB-9 Serial Port on your Windows PC

922-0565 "Cable, PC Connect"

922-0675 "Cable, PC Adaptor, DB9/DB25, black"

DB-25 Serial Port on your Windows PC

922-0565 "Cable, PC Connect"

The PC Connect cable is a DIN-8 to DB25 cable. The DIN-8 Connector is the port used on the Apple MessagePad. The PC Adaptor is a DB25 to DB9 cable that goes on the end of the PC Connect cable.

You can purchase these cables from an Apple Service Center, or you can use any compatible third-party cable.

QuickTake 200: Problems Installing Adobe Software (3/97)

=====
Article Created: 21 March 1997
Article Reviewed/Updated: 24 March 1997

TOPIC -----

On the initial CD-ROM discs containing Adobe PhotoDeluxe and Adobe PageMill 2.0, there was a problem with the serial number printed on the CD jacket for PhotoDeluxe. There are also problems installing the software. This article contains the workarounds for the problems.

DISCUSSION -----

Adobe PhotoDeluxe Serial Number Issue
=====

The serial number printed on the CD-ROM jacket is incorrect.

If the printed the serial number begins with HEWxxxxxxxxxxxx-xxx

The correct serial number is: HFWxxxxxxxxxxxx-xxx (Note the second character is different)

Installation Problems with Adobe PageMill & PhotoDeluxe
=====

When customers try launching either the Adobe PageMill installer or Adobe PhotoDeluxe installer icons at the root level, they will hear a beep once and the installer will not open. The workaround is listed below.

Adobe PageMill

Step 1

Open the Adobe PageMill 2.0 folder

Step 2

Open the Adobe PageMill 2.0 folder

Step 3

Open the Disk 1 folder

Step 4

Launch the Install Adobe PageMill icon.

Adobe PhotoDeluxe

Step 1

Open the Adobe PhotoDeluxe folder

Step 2

Open the Install Adobe PhotoDeluxe folder

Step 3

Open the Install-Disk 1 folder

Step 4

Launch the Adobe PhotoDeluxe Installer icon.

Adobe's technical support staff has been informed of the workarounds and Apple is currently replacing the CD-ROM discs, so customers get a working CD-ROM Disc out of the box.

Where Are OT/PPP Control Panel Settings Stored? (4/97)

=====

Article Created: 1 April 1997
Article Reviewed/Updated: 2 April 1997

TOPIC -----

Where are the Open Transport/PPP control panel settings stored?

DISCUSSION -----

The configuration information entered through the PPP control panel are stored in the Remote Access Connections document (System Folder:Preferences:Remote Access:Remote Access Connections). Removal of this file clears all PPP control panel preferences including saved configurations and connect scripts.

Modem scripts used by OT/PPP are stored in the same location as ARA modem scripts, (System Folder:Extensions:Modem Scripts).

Modem control panel settings are stored in the Modem Preferences file (System Folder: Preferences: Modem Preferences).

PowerBook 1400: No Caps Lock Extension With Mac OS 7.6 (4/97)

Revised: 4/1/97
Security: Everyone

PowerBook 1400: No Caps Lock Extension With Mac OS 7.6 (4/97)

=====

Article Created: 1 April 1997

TOPIC -----

I just installed Mac OS 7.6 on my PowerBook 1400 and now when I press the Caps Lock key the icon does not appear in the menu bar. How do I get the icon back?

DISCUSSION -----

By default, the Mac OS 7.6 installer does not install the Caps Lock extension (which enables the menu bar icon), however, the extension can be custom installed. To custom install the Caps Lock extension with the Mac OS 7.6 Installer, follow the steps below:

- 1) Insert the Mac OS 7.6 CD.
- 2) Open the Software Installers folder on the CD. You may need to scroll down to see the Software Installers folder.
- 3) Open the Mac OS 7.6 folder.
- 4) Double click the Installer icon.
- 5) Click Continue... .
- 6) Click Agree.
- 7) Choose Custom Install from the pop-up menu ("Easy Install" is the default choice).
- 8) Click on the triangle next to Mobility.
- 9) Check the box next to Caps Lock.
- 10) Click Install.
- 11) When the installer has finished, restart the PowerBook and the Caps Lock icon will show up in the menu bar whenever the Caps Lock key is activated.

NOTE: Some PowerBook 1400 computers shipped with Mac OS 7.6 installed, and they may not have the Caps Lock extension in the Extensions folder. In these cases, follow the same steps above to install the Caps Lock extension, but use the PowerBook 1400 System CD that comes with the computer instead of the Mac OS 7.6 CD.

Power Macintosh 7200, 7500 & 7600: Changing Fan Speed (4/97)

Revised: 4/3/97
Security: Everyone

Power Macintosh 7200, 7500 & 7600: Changing Fan Speed (4/97)

=====

Article Created: 02 April 1997

TOPIC -----

Customer says he has noticed the Power PC 7600 fan speed apparently increases with changes in temperature. When the case is removed, the fan speed appears to decrease. Is this normal opperation?

DISCUSSION -----

The change in the speed of the fan is normal. The power supply used in the Power Macintosh 7200/7500/7600 enclosure contains a fan speed control circuit. The circuit is designed to monitor the temperature of two critical heatsinks used in the power supply and as the temperature of those heatsinks rises and lowers, the speed of the fan is adjusted to compensate for the change in temperature.

PC Compatibility Card: 80 Character Text File Printing (4/97)

Revised: 4/3/97
Security: Everyone

PC Compatibility Card: 80 Character Text File Printing (4/97)

=====

Article Created: 3 April 1997

TOPIC -----

When printing ASCII or Epson LQ-2500 print jobs from the PC environment to a PostScript printer, the print out will be cut off halfway through the 77th column.

DISCUSSION -----

This is a known issue with the way PC Print Spooler converts ASCII or Epson print jobs into PostScript. Apple expects this to be resolved in the next release of the PC Setup software.

Workarounds

- Print to a QuickDraw-based printer.
- In the DOS environment print to a file. Then open the file in a Windows-based word processing application like NotePad, WordPad, or Word and then print. Since Windows has its own PostScript driver, it will generate the PostScript, and PC Print Spooler will not have to modify this print job because it is already in PostScript. This workaround is fine if you can print to a file, however, some applications will not let you do this.
- Adjust the AUTOEXEC.BAT file by following these steps:
 - Step 1
Open the PC Setup control panel
 - Step 2
Select COM1 to be "New Text File..." and give the file a name.
 - Step 3
Add the following line to AUTOEXEC.BAT:

```
mode lpt1=com1
```

This will redirect LPT1 output to COM1. Since COM1 will be saved as a file, you will have the ASCII text file in the Macintosh environment.

Step 4

To activate the port redirection, restart the PC environment for the new AUTOEXEC.BAT to be loaded or retype the above line at the command prompt.

Step 5

From the Macintosh environment, open the text file with a text editor or word processing application. SimpleText will work, but you will need to change the font size to 10 point to get 80 columns.

Mac OS 7.6 and QuickTime Issue (4/97)

Revised: 4/30/97
Security: Everyone

Mac OS 7.6 and QuickTime Issue (4/97)

=====

Article Created: 3 April 1997
Article Reviewed/Updated: 30 April 1997

TOPIC -----

This article describes an issue between Mac OS 7.6 and QuickTime.

DISCUSSION -----

A bug in the memory manager can cause a system crash when running Mac OS 7.6 and applications using QuickTime. Although this issue can be encountered using any application which uses QuickTime, it will most likely be encountered during memory intensive tasks such as compressing QuickTime movies in high end video editing programs. Increasing the memory allocation for the video application may help avoid this, but the best way to avoid this problem is to upgrade to Mac OS 7.6.1, which fixes this bug.

Note: this problem only occurs only with Mac OS 7.6. It does not occur with System 7.5.5 or earlier versions of system software, nor does it occur in Mac OS 7.6.1 or later.

Article Change History:
30 Apr 1997 - Added information about Mac OS 7.6.1.

Apple Video Player: Radio Sound Only (4/97)

Revised: 4/4/97
Security: Everyone

Apple Video Player: Radio Sound Only (4/97)

=====

Article Created: 04 April 1997

TOPIC -----

When the Apple Video Player and Apple FM Radio are both open, you will only hear the audio from the radio even when the TV is the foreground process.

DISCUSSION -----

You can watch TV and listen to the radio at the same time, but the radio sound takes precedence. To hear the TV, make sure you have quit the Apple FM Radio application. To do so, click the FM Radio window to make it active, then choose Quit from the File menu.

NOTE: The radio sound doesn't work if Video or S-Video is selected in the Apple Video Player application (even if that application isn't currently open). Open the Apple Video Player application and choose Show Controls from the Windows menu. Click the video screen icon (the second button down on the left). Choose TV as your video source. You can then quit the Apple Video Player application. Now when you open the Apple FM Radio application, you will hear radio.

PC Compatibility Card: At Ease 3.x Errors (4/97)

Revised: 4/4/97
Security: Everyone

PC Compatibility Card: At Ease 3.x Errors (4/97)

=====

Article Created: 04 April 1997

TOPIC -----

I get several memory related error messages when using my PC Compatibility card, with At Ease 3.0.1, in a Power Macintosh 9500/132 with System 7.5.3.

One of the errors reads: "There is not enough memory to open the 'PC Clipboard' application. You will not be able to transfer the clipboard contents between the Macintosh and PC. Try quitting an open application."

Whenever I try to print from the PC Environment nothing prints out. If I switch to the Mac environment I get the following error: "There is not enough memory to open the 'PC Print Spooler' application. Files printed from the PC will be printed when more memory becomes available."

I've got 80MB installed in my Power Macintosh 9500 and I have tried raising and lowering the memory to both PC Print Spooler and PC Clipboard with no change.

If I switch to a user in At Ease that has full Finder access, then I do not get these errors. I do get similar errors in the restricted Finder. In some cases I won't get the error, but nothing will print until I log out.

DISCUSSION -----

In order to have Windows Clipboard and printing support when running At Ease, the PC Clipboard and PC Print Spooler applications need to be added to the list of user applications.

When they are added, they will show up on the At Ease panel like any other application. No damage can result from clicking on either PC Clipboard or PC Print Spooler. PC Clipboard will launch and automatically quit. PC Print Spooler will launch and a status window will appear. Users can change the preferences in PC Print Spooler.

Once PC Print Spooler is running (whether through printing or clicking on its

icon in a panel) it will always become the foreground application when switching between Windows and the Mac OS. Users must either select Quit from the File menu or change to At Ease under the Application Menu.

If you do not wish to add PC Print Spooler to a user's At Ease screen, any jobs printed will print when the user logs out. There is no need to log in to the Finder to print. PC Print Spooler will startup and run at the login screen, printing any previously queued jobs.

Macintosh Computers: Printer Port Reset (4/97)

Revised: 4/9/97
Security: Everyone

Macintosh Computers: Printer Port Reset (4/97)

=====

Article Created: 04 April 1997

TOPIC -----

Whenever I try to select the Printer Port in my Chooser, for my serial printer, I keep getting a message saying "port in use", or "port currently in use by another application", or "port already in use". Why am I getting these messages and how can I release the port from whatever application is using it?

DISCUSSION -----

If the printer port has been in use by a QuickTake camera or by AppleTalk, then the serial printer is not going to work from the Printer Port until the port is reset.

You can reset the printer port by:

1). Selecting AppleTalk Inactive in the Chooser and restarting. If, after restart, AppleTalk shows "inactive" but you are still getting this message, your next step would be to reset the parameter RAM.

2) Resetting Parameter RAM (PRAM)

Restart the Macintosh and when you hear the startup sound, hold down the COMMAND-OPTION-R-P keys and continuing to hold the keys until the computer has "chimed" four times. AppleTalk will be "active" after this procedure so you will need to make it "inactive" in the Chooser and restart again.

3) If the Chooser shows AppleTalk "inactive" but you are still getting the "port in use" message your next step is to select the Imagewriter printer driver in the Chooser, then select the Printer Port.

Half-Height Drive: Physical Dimensions (4/97)

Revised: 4/9/97
Security: Everyone

Half-Height Drive: Physical Dimensions (4/97)

=====

Article Created: 09 April 1997

TOPIC -----

What are the physical dimensions of the half-height drives?

DISCUSSION -----

A typical 3.5-inch low-profile (1-inch high) HDA, also known as "half height", has the following physical dimensions.

Physical dimensions:

Height 1 inch
Width 4 Inches
Length 5.75 Inches

Other form factors in popular use on the Macintosh line are full-height drives, meant for use on the earliest all-in-one Macintoshes and the third-height drives supported by the mounting brackets used in the Workgroup Servers like the Power Macintosh 8550.

PowerBook 1400:Target Disk Mode & Internal CD drive (4/97)

=====

Article Created: 09 April 1997

TOPIC -----

The media bay CD-ROM drive for the PowerBook 1400 does not mount when the PowerBook is placed in Target Disk Mode. Is there something wrong?

DISCUSSION -----

There is nothing wrong with the comptuer. The media bay CD-ROM drive does not support Target Disk Mode. An external CD-ROM drive can be used in the SCSI chain with the appropriate termination.

For more information on SCSI/Target Disk Mode, please see the following Tech Info Library articles:

"PowerBook: Miscellaneous Frequently Asked Questions"

"PowerBook: Which Models Support SCSI Disk Mode"

"PowerBook: SCSI Disk Mode and Termination"

PC Compatibility Card: No Video W/ 3rd Party Video Card (4/97)

Revised: 4/10/97
Security: Everyone

PC Compatibility Card: No Video W/ 3rd Party Video Card (4/97)

=====

Article Created: 10 April 1997

TOPIC -----

I am having trouble using the 7" and 12" PC Compatibility Card along with a 3rd party video card.

When the 3rd party video card is installed into a Power Macintosh and the PC Compatibility Card and Mac video are daisy chained into one display the monitor does not work.

Under this same configuration, if I then attach two separate monitors (example: 17" monitor attached to PC Compatibility Card and a 14, 17 or 20" monitor attached to the 3rd party video card), everything is okay. Both sides display fine.

Why is this occurring?

DISCUSSION -----

The design of certain 3rd party video cards omits the ground signal on pin 14 of the DB-15 connector on their video cards. The PC Compatibility Card checks for ground on pin 14 to determine if a monitor/video card is connected.

The system won't exhibit this behavior when using two monitors because the monitor is grounding the signal on pin 14 of the PC Card video connector.

Apple DOS And PC Compatibility Cards: Where Is BIOS? (4/97)

Revised: 4/14/97
Security: Everyone

Apple DOS And PC Compatibility Cards: Where Is BIOS? (4/97)

=====

Article Created: 10 April 1997
Article Reviewed/Updated: 14 April 1997

TOPIC -----

This article describes the Basic Input/Output System (BIOS) on the DOS Compatibility Card and the PC Compatibility Card.

DISCUSSION -----

The BIOS code is actually stored as a resource in the PC Setup control panel and loaded into CMOS on the card when the booted. Because of this design, it is possible to update the BIOS by installing a new BIOS resource into the PC Setup control panel.

The CMOS on the card is volatile. Therefore, every time the Macintosh is shut down the CMOS on the card is erased. Note that just shutting down the PC or restarting the Macintosh is not sufficient to drain CMOS. The Macintosh must be completely powered off. Also note that it may take several minutes for the memory to be lost. When the Macintosh is powered up again, the CMOS is restored by the PC Setup control panel.

There is no user support for changing BIOS settings, such as adding password protection and the like. If you were able to actually look at the settings you would see that there are no drives. Further, if you were to change the BIOS so that drive A: is a floppy and drive C: is something else, the floppy drive would not work and the PC might not boot.

MessagePad 2000: Hard Reset When Changing Batteries (4/97)

Revised: 4/14/97
Security: Everyone

MessagePad 2000: Hard Reset When Changing Batteries (4/97)

Article Created: 11 April 1997
Article Reviewed/Updated: 14 April 1997

TOPIC -----

When I insert my batteries into my MessagePad 2000, I receive the message:

"Do you want to erase data completely?" [Yes][No]

If I tap "yes", I receive the message:

"All your data will be lost. Do you want to continue?" [OK][Cancel]

What is this message, and why does it appear?

DISCUSSION -----

This message is part of the "hard reset" process, which is used to erase all data and information in the MessagePad's internal memory. For more information on hard resets, see page 230 of your MessagePad 2000 User's Guide.

The message appears because the power switch is down while the Newton MessagePad "cold boots". A cold boot occurs when the MessagePad is started after a period without power. The two most likely situations are as follows:

1) No AC adaptor, no batteries. Insert AC adaptor. The MessagePad 2000 will turn itself on automatically. If the switch is depressed within the first few seconds, then the "cold boot" process will display the "hard reset". Users should refrain from using the power switch for about 5 seconds after inserting the AC adaptor to prevent the hard reset message from appearing. The unit does not boot any sooner if you use the switch.

2) No AC adaptor, no batteries. Insert batteries. The MessagePad 2000 will remain off, and will cold boot when the power switch is depressed. However, if you hold the power switch, the cold boot process will display the "hard reset."

There are other, more esoteric cold boot situations as well. Remember to avoid holding down on the power switch.

This behavior is identical to previous MessagePad models, but the MessagePad 2000 has a power switch that is easier to reach, increasing the likelihood of displaying the "hard reset" message.

If you have accidentally erased your MessagePad, you can reload the bundled applications from the "Backup Disks" and you can restore personal data you have backed up with Newton Connection Utilities.

In order to reduce customer confusion, Newton Systems Group will add an addendum to the MessagePad 2000 box that states:

Resetting your MessagePad or installing batteries

When you do a software reset or you slide down and hold the Power switch after installing batteries, a message may appear asking if you want to erase your data completely. Tap No and your MessagePad will restart without erasing any information.

For more information about software resets, see the section, "Resetting the MessagePad" in the MessagePad 2000 User's Manual. For more information on installing batteries, please see "Appendix A: Installing and Replacing Batteries" in the MessagePad 2000 User's Manual.

QuickTime VR for Windows: Component File Versions (4/97)

Revised: 4/11/97
Security: Everyone

QuickTime VR for Windows: Component File Versions (4/97)

=====

Article Created: 11 April 1997

TOPIC -----

I sometimes get errors and crashes when using QuickTime VR for Windows. Some of the Windows error messages are "General Protection Fault", "Program Error Occurred", or "Segmentation Fault". These errors sometimes show up when using QuickTime VR in an Apple Media Tool project running on Windows. What's wrong?

DISCUSSION -----

An older version of the QuickTime VR component file is being used with a newer version of QuickTime for Windows. To correct the problem, you will need a copy of the QuickTime VR component file that matches the version of QuickTime for Windows loaded on your PC.

The QuickTime VR component file is called QTVRW.QTC for the 16-bit version.

If you are using Windows 95, you can use the "Properties" command to check the QTVRW.QTC file's version number. The QTVRW.QTC file may be located in the C:\WINDOWS\SYSTEM directory, with your application, or both. Be sure to verify that your disk does not contain multiple copies of this file.

Version 1.0.3.10 of QTVRW.QTC is available for download from <http://quicktime.apple.com> and should be used with QuickTime for Windows 2.1.2.

If you experience this behavior with QTVRW.QTC 1.0, try reinstalling QuickTime for Windows version 2.0.3.

Newton Internet Enabler: Overview (4/97)

=====

Article Created: 14 April 1997

TOPIC -----

This article offers an overview of the Newton Internet Enabler.

DISCUSSION -----

The Newton Internet Enabler (NIE version 1.0) - TCP/IP provides capabilities for the Newton 2.0 platform. Use and knowledge about this product is covered and bound by the terms of the license you will need to execute with Apple Computer, Inc.

NIE v1.0 offers:

- Support for TCP and UDP protocols
- over PPP and SLIP
- domain name resolver
- dialer with scripting capability

NIE v1.0 enables dial-up access to an Internet Service Provider (ISP) or any IP-based solution, including web browsers or POP/SMTP mail. Enclosed with the packages you will also find sample code and reference documentation. Please be sure to read the release notes for issues that may arise using NIE 1.0.

Avid Cinema: No Menu Items Available (4/97)

Revised: 4/15/97
Security: Everyone

Avid Cinema: No Menu Items Available (4/97)

=====

Article Created: 15 April 1997

TOPIC -----

When Avid Cinema is launched, all menus except the File menu are grayed out and the only menu item available is Quit. What's happening?

DISCUSSION -----

This can happen after installing America Online 3.0. Some versions of AOL 3.0 install ObjectSupportLib 1.1.4. ObjectSupportLib 1.1.4 is incompatible with Avid Cinema and will cause the behavior you described.

The solution is to drag the ObjectSupportLib file from your Performa CD into your Extensions folder, replacing the incompatible version, and then restart.

The ObjectSupportLib file can be found by following this path on the Performa CD:

Begin_Table

Performa CD

Hard Disk Files

System Folder Files

Extensions

ObjectSupportLib

End_Table

Performa 6360 & 6400: Performa Demo and -108 Error (4/97)

Revised: 4/16/97
Security: Everyone

Performa 6360 & 6400: Performa Demo and -108 Error (4/97)

=====

Article Created: 16 April 1997

TOPIC -----

I have a Performa 6360 & 6400 computer and have just upgraded my system software to 7.5.5. Now when I try to click the "Sign-Up with Apple" button in the Performa Demo, I get a blank dialog box with a -108.

What is this error and how can I avoid the problem?

DISCUSSION -----

The error is an out of memory error. It means that there is not enough memory to run both the Performa Demo and the "Sign-Up with Apple" application. The Performa Demo was designed to run with system software 7.5.3, Revision 2.2 on a Performa 6360 or 6400 computer with 16 MB of physical memory.

After updating the system software to 7.5.5, the memory requirements for the system software increase slightly. This slight increase is enough to prevent both the Performa Demo and the "Sign-Up with Apple" application to run simultaneously. There are 2 workarounds that will allow Performa 6360/6400 users with 16 MB of memory and running system software 7.5.5 to avoid this -108 error. They are as follows:

- 1) Turn Virtual Memory on (set to 17 MB and restart the computer)
- 2) Install more physical memory than 16 MB

Avid, MPEG and Video-In Card Compatibility (4/97)

Revised: 4/16/97
Security: Everyone

Avid, MPEG and Video-In Card Compatibility (4/97)

=====

Article Created: 16 April 1997

TOPIC -----

This article provides information on compatibility between the Apple Video-In cards, the Avid Cinema card, and the Apple MPEG card.

DISCUSSION -----

The Avid Cinema Card has a 60-pin connector and comes with a 60-pin ribbon cable; therefore, it must be used with the Video-In Card, Rev. D, which also has a 60-pin connector.

The Avid Cinema card is not compatible with the older Video-In Card, Rev. B, because of the difference in the connector sizes.

The Apple MPEG card has a 34-pin connector and comes with a 34-pin ribbon cable; therefore, it must be used with the older Video-In Card, Rev. B, which also has a 34-pin connector.

The Apple MPEG card is not compatible with the Video-In Card, Rev. D, because of the difference in the connector sizes.

Note that both versions of the Video-In Card provide the same performance.

PowerBook 500 Series: Voltages For Low Battery Warnings (4/97)

Revised: 4/16/97
Security: Everyone

PowerBook 500 Series: Voltages For Low Battery Warnings (4/97)

=====

Article Created: 16 April 1997

TOPIC -----

I have a PowerBook 500 series computer. I would like to know what the battery voltage levels are when the battery warnings appear.

DISCUSSION -----

There are two factors to take into consideration when discussing the battery voltage levels and the accompanying on-screen warnings:

- the battery warning voltage parameters are contained in the system enabler file, so if a new enabler comes out (such as in a system update or new system software) these voltages may change.
- when a battery is removed and then its voltage is checked, the voltage reading will be slightly higher since the battery is not under a load as it would be inside the PowerBook.

The voltages and their accompanying warnings for the PowerBook 500 series are:

Begin_Table

Full Battery	11.7 - 12.3 volts
1st warning	11.35 volts
2nd warning	11.15 volts
3rd warning	11 volts

End_Table

SCSI Disk Mode: Start Up Error Message (4/97)

Revised: 4/23/97
Security: Everyone

SCSI Disk Mode: Start Up Error Message (4/97)

Article Created: 17 April 1997
Article Reviewed/Updated: 23 April 1997

TOPIC -----

I have a PowerBook in SCSI Disk Mode (also known as HD Target Mode) connected to another Macintosh computer. After I turn the PowerBook on and get the moving SCSI icon and then try to turn on the other computer, I get an error message telling me that I'm using the wrong system software.

DISCUSSION -----

The host computer is trying to boot from the PowerBook hard drive. Follow these steps to remedy the situation:

- 1) Turn the host Macintosh off by pressing the power button.
- 2) Turn the PowerBook in SCSI disk mode off by pressing the power button.
- 3) Disconnect the SCSI cable from the host Macintosh.
- 4) Start up the host Macintosh.
- 5) Open the Startup Disk control panel and select the internal hard drive.
- 6) Shut down the host Macintosh.
- 7) Reconnect the SCSI cable.
- 8) Turn on the PowerBook.
- 9) Turn on the host Macintosh.

The host computer should now boot up from its own internal hard drive.

Fax Option Cards: Year 2000 Support (4/97)

=====

Article Created: 17 April 1997

TOPIC -----

Is the date/time stamp kept on the fax card or by the computer? If kept by the fax cards will they support the year 2000 date when we reach it.

DISCUSSION -----

PostScript Fax Option Cards maintain their own clock which is supported by a long-life battery when the LaserWriter is off. This Fax clock is compatible with and accepts the new millennium date formats, such as March 10, 2000.

The date and time may be set from Macintoshes via the LaserWriter Fax Utility, or from DOS/Windows®3.1 via the Fax Control Panel. Step-by-step procedures for changing the clock settings are documented in the Fax Card User's Guide.

This pertains to any Apple Fax Option Cards available for the LW Pro 810, LW Select 360, and LW 16/600.

PC Exchange: Floppy Format Problem (4/97)

Article Created: 17 April 1997

TOPIC -----

I installed PC Exchange 2.0.7 on a Performa 5300 and it does not work. What is wrong?

DISCUSSION -----

PC Exchange 2.0.7 is only for use with those Macintosh models that can support one of the PC Compatibility Cards or the DOS Compatibility Card. It will not run on all systems and is only available in the PC Setup 1.5 installer.

The machines supported by PC Exchange 2.0.7 are as follows:

Power Macintosh 6100/60 and all Performa 61xx variations
Power Macintosh 6100/66 and all Performa 61xx variations
Power Macintosh 7200 and 8200 series
Power Macintosh 7500 and 7600 series
Power Macintosh 8500 and 8600 series
Power Macintosh 9500 and 9600 series
Power Macintosh 5400 series

Quadra 630, LC 630 and all Performa 63x and 640 models

Performa 580
Performa 6360 and 64xx series

Note: Some of the systems above were released after PC Exchange 2.0.7 was tested, so PC Exchange may have problems on some of the later models.

If you are having problems with PC Exchange 2.0.7, PC Exchange 2.1.1 is now available with Mac OS 7.6

QuickTake 200: PowerBook Connection Issues (4/97)

Revised: 4/30/97
Security: Everyone

QuickTake 200: PowerBook Connection Issues (4/97)

=====

Article Created: 30 Apr 1997

TOPIC -----

This article dicusses issues with connecting a QuickTake 200 to different PowerBook models.

DISCUSSION -----

QuickTake 200 customers may encounter connection issues with their QuickTake camera and different PowerBook models. Below are areas to check when connecting a QuickTake camera to a PowerBook:

PowerBook 3400 w/internal modem

- Open the Modem Control Panel
- Set port to "Modem/Printer Port". DO NOT USE "Internal Modem".
- Save modem settings
- Close Modem Control Panel
- Select Chooser from the Apple Menu
- Select "Inactive for AppleTalk"
- Reboot machine (if you close internal modem from its "Close" menu item, you don't need to restart machine)

Other PowerBooks w/internal modem

- Select the PowerBook Control Panel
- Set to "Normal" mode
- Close the window
- Select Chooser from the Apple Menu
- Select "Inactive" for AppleTalk

Mac OS 7.6.1: RAM Disk Problem (5/97)

Revised: 5/5/97
Security: Everyone

Mac OS 7.6.1: RAM Disk Problem (5/97)

Article Created: 05 May 1997

TOPIC -----

I installed Mac OS 7.6.1 and setup a RAM disk. Now, when I try to shut the system down, the screen goes blank but the message saying it is safe to shutdown the system does not appear. On systems that power on from the keyboard, they will not shutdown so I have to use the button on the back of the CPU. What is wrong?

DISCUSSION -----

A problem has been found in Mac OS 7.6.1 that causes this problem but does not effect all Macintosh models. Apple is working on a solution and it will be available in Mac OS 8. In the meantime, downgrading to Mac OS 7.6 will resolve the issue.

This freeze occurs immediately preceding the display of the shutdown message or the system powering off. At this point, it is safe to turn off the system.

AppleVision 850AV Display: Technical Specifications (5/97)

=====

Article Created: 5 May 1997

TOPIC -----

This article gives the technical specifications for the AppleVision 850AV Display

DISCUSSION -----

Picture Tube

- * 20-in. (diagonal) Trinitron CRT
- * 19-in. (diagonal viewable image size)
- * 0.26-mm aperture grille pitch

Resolution*

Macintosh Computers

- * 640 x 480 pixels
- * 800 x 600 pixels
- * 832 x 624 pixels
- * 1,024 x 768 pixels
- * 1,152 x 870 pixels
- * 1,280 x 1,024 pixels
- * 1,600 x 1,200 pixels

PC-Compatible Systems

- * 640 x 480 pixels
- * 800 x 600 pixels
- * 1,024 x 768 pixels
- * 1,280 x 1,024 pixels
- * 1,600 x 1,200 pixels

Scanning Rates

- * 30 kHz to 94 kHz (horizontal)

- * 48 Hz to 120 Hz (vertical)

Apple DigitalColor Technology

- * Internal calibration to original factory measurements
- * Adjustment for ambient lighting
- * Adjustment for CRT phosphor aging

Multimedia Features

- * Integrated high-quality stereo speakers
- * Directional microphone
- * Stereo headphone connector

Screen Treatment

- * Antistatic, anti-reflective coating

Digital Software and Hardware Controls

- * Power on/off
- * Brightness
- * Contrast
- * Horizontal size and centering
- * Vertical size and centering
- * Convergence
- * Rotation
- * Pincushion
- * Keystone
- * Parallelogram
- * Gamma curve
- * Completely variable white-point selection: 4,100 degrees K to 9,300 degrees K
- * Bass control
- * Treble control
- * Volume control
- * Microphone mute
- * Speaker mute

Audio

- * Watts: 5 volts RMS, each channel
- * Frequency response: 80 Hz to 17 kHz
- * Speaker output: > 90 (dB) SPL at 1 KHz at 0.5 meters
- * Headphones: 600 ohm >0.5 volts RMS

Connector

- * 15-pin DSub connector for Macintosh systems
- * 15-pin DSub VGA mini-adapter for PCs

Degauss Circuitry

- * Automatic at power up

Electrical Requirements

- * Line voltage: 90 to 132 V AC and 198 to 264 V AC
- * Frequency: 47 to 63 Hz, single phase
- * Power: 180 W (maximum) when operating; less than 30 W in standby mode; 5 W (speakers off) or 30 W (speakers on) in suspend mode and when CPU is in energy-saver mode

Environmental Operating Requirements

- * Temperature: 50 degrees to 104 degrees F (10 degrees to 40 degrees C)
- * Humidity: 20% to 95%, noncondensing
- * Altitude: 0 to 10,000 ft. (0 to 3,048 m)

Size and Weight

- * Height: 21.8 in. (55.5 cm)
- * Width: 19.1 in. (48.5 cm)
- * Depth: 23.4 in. (59.5 cm)
- * Display weight: 78.0 lb. (35.4 kg)
- * Fully boxed weight: 92.1 lb. (41.9 kg)

Agency Approvals

- * FCC Part 15 Class B
- * CISPR 22 Class A (EN5008211) -- complies with European EMC directive
- * DOC Class B
- * MPR-II
- * VCCI Class 2
- * CE Mark
- * EPA Energy Star compliant
- * IEC 950
- * UL 1950
- * CSA 950
- * EN60950
- * NUTEK
- * TCO 92

System Requirements

- * Works with Power Macintosh, Macintosh Performa, and Macintosh Quadra computers with 68040 or later microprocessors running Macintosh System 7.1 or later*
- * Windows 95 Plug and Play certified

*Not all models and configurations are capable of driving the monitor to the highest resolution it supports.

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Mac OS 7.6.1 Update Read Me (5/97)

Revised: 5/5/97
Security: Everyone

Mac OS 7.6.1 Update Read Me (5/97)

Article Created: 5 May 1997

TOPIC -----

This article is the About Mac OS 7.6.1 Update Read Me file.

DISCUSSION -----

Mac OS 7.6.1 Update Overview and Installation.

Who can use Mac OS 7.6.1 Update?

Mac OS 7.6.1 Update improves the reliability of Mac OS computers.
If you are using a system software version prior to Mac OS 7.6, you must upgrade to Mac OS 7.6 before you install this update. Additionally, some newer PowerBooks, introduced after Mac OS 7.6, cannot use this update. To see if your computer can use this update, see "How Do I Know What Version of System Software I Have?" below.

IMPORTANT: Do not install this update if you have a Macintosh Performa 4400 or a Power Macintosh 4400, 5500, 6500, 7300, 8600, or 9600 series computer. You can obtain Mac OS 7.6 and Mac OS Update 7.6.1 through the Mac OS Up-To-Date program. If you have a PowerBook 3400, you need to download the Mac OS 7.6.1 Update for the PowerBook 3400. For more information, see the Mac OS Up-To-Date Web site at <<http://www.macos.apple.com/macos/releases/fulfillment.html>> or call 800-335-9258.

How do I know what version of system software I have?

To find out what system software version your computer is using, follow these steps:

- 1) Make sure you are in the Finder. (To switch to the Finder, open the Application menu, marked with an icon in the upper-right corner of your screen, and choose Finder.)

2) Open the Apple menu, located at the upper-left corner of your screen.

- If the first item in the Apple menu is called About This Computer, choose this item from the menu. In the box that appears, check the words in the upper-right corner. If you see the word "Enabler" under the line that reads "System Software 7.6," you cannot install this update. If you see "PowerBook 3400 1.0," then you need to download the Mac OS 7.6.1 Update for the PowerBook 3400. If the update is not currently available, it should be available soon. If there is no text between the line that reads "System Software 7.6" and the copyright notification, you can proceed with the installation.
- If the first item in the Apple menu is called About This Macintosh, you have an earlier version of system software. You must upgrade to Mac OS 7.6 before you can install this update.

What's included in the Mac OS 7.6.1 Update?

After you install the Mac OS 7.6.1 Update, you should notice improved stability, as well as the following fixes and enhancements:

- Nearly all Type 11 errors eliminated
Type 11 errors force you to restart the computer without saving your work. Most of these errors are now properly classified as Type 1 or Type 2 errors, which cause the active application to quit, but do not force you to restart the computer. Type 11 errors occur while using "native" applications used by computers with PowerPC processors.

IMPORTANT : When you get an error that forces a program to quit, you should still save your work in other open programs and restart the computer.

- Type 112 errors eliminated
Type 112 errors, which occurred when using some multimedia applications, have been eliminated.
- CFM-68K Runtime Enabler included for computers with 68030 and 68040 processors
Computers with 68030 and 68040 processors can now use programs that require the CFM-68K Runtime Enabler. The CFM-68K Runtime Enabler is a system extension which allows application programs to share code resources. Because of a problem with this extension, it was not included with Mac OS 7.6. This problem has been fixed.

Apple products that use the CFM-68K Runtime Enabler include OpenDoc, the LaserWriter 8.4 driver, Apple Telecom software 3.0 and later, and the Apple Media Tool. Applications from other companies that require the CFM-68K Runtime Enabler include America Online 3.0 and Internet Explorer 3.0. (If you continue to experience problems with non-Apple programs that use the CFM-68K Runtime Enabler, contact the manufacturer.)

- Improved compatibility with serial devices when using Performa 5400 and 6400 and PowerBook 3400 computers

Equipment connected to the serial port now communicates correctly with these computers. (Previously, some devices using the serial port were not recognized by these computers if the devices were connected when the computer started up.)

- Infrared problems fixed on PowerBook 1400 and 3400 computers
The computer no longer freezes if the infrared window is blocked when the computer is starting up or transferring files.
- Improved reliability when using large QuickTime files, or using QuickTime in low-memory situations
Application programs that use QuickTime files work more reliably when working with large files and when using QuickTime files in low-memory situations.
- Printing improved for Performa and Power Macintosh 5400 and 6400 series computers using non-Apple printers over LocalTalk networks
Performa and Power Macintosh 5400 and 6400 computers now print at an acceptable speed on non-Apple printers over a LocalTalk network. (Previously, printing was very slow.)
- Video applications recognize that MPEG is installed
Video applications, including the Apple Video Player, now correctly recognize when MPEG software or hardware is installed.
- Storage PC Cards no longer require a utility program to appear on the desktop
PC Cards used for storage now appear on the desktop when inserted. A mounting utility program is no longer required.
- Only two low-battery messages displayed on PowerBooks before computer shuts itself down
Only two low-battery messages are displayed, instead of three, before the computer shuts itself down. The first message appears approximately two to four minutes before shutdown. The second occurs approximately ten seconds before shutdown.
- PowerBook 1400 computers now wake from sleep faster
When you wake the computer, there is less of a delay before the screen appears.
- Contrast and brightness controls work as expected on PowerBook 1400 computers
The screen will get brighter or show more contrast when the plus (+) controls are pressed. Previously, the functionality of the plus (+) and minus (-) controls were reversed on PowerBook 1400 computers.
- On the PowerBook 3400, the CD-ROM drive works correctly if inserted when the computer is on
The removable CD-ROM drive now appears correctly on the desktop if it is inserted in the expansion bay while the computer is on.
- New version of Apple System Profiler

IDE-based CD-ROM drives, such as the built-in CD-ROM drive for the PowerBook 1400, are now listed in the Apple System Profiler window.

- New version of AppleVision software
A new version of AppleVision software improves reliability on computers that currently use AppleVision monitors.
- Graphics acceleration software works correctly with a universal System Folder
Graphics acceleration software now works correctly when used with a universal System Folder. Additionally, the Graphics Accelerator extension and the Graphics Accelerator 2 extension have been merged into the ATI Graphics extension.
- New version of Apple Video Player
Video-capture and TV tuner PC Cards now work correctly on PowerBook 3400 computers. Additionally, all computers can use the AppleScript scripting language to automate tasks in Apple Video Player.
- Settings in Energy Saver control panel are saved properly
Changes made to automatic startup and shutdown settings are now saved.
- Large files copied between IDE hard disks sometimes crashed the system
Files over 1 MB can now be copied between two IDE hard disks without causing a system crash.
- Better performance when using video-capture expansion cards and ATI accelerators
Video capture is faster on computers when using video-capture PCI expansion cards with ATI graphics accelerators.

Besides the bug fixes provided by Mac OS 7.6.1 Update, several of the bug fixes and features that have been previously released as extensions are now part of the OS. You may notice that these extensions have been removed from the Extensions folder. After installing the Mac OS 7.6.1 Update, you will no longer need these extensions in your Extensions folder.

- 54xx/64xx Update version 1.0
- 54xx/64xx Update version 1.1
- 7.5.5 SCSI Server Update
- Assistant Toolbox
- PCI Network Legacy Layer version 1.0
- PCI Network Legacy Loader version 1.0
- PowerBook 1400 ATA Flash
- PowerBook 1400 PMU Updater

- PowerBook VM Tuner for OS 7.6
- PowerMac Format Patch
- PowerPC Interrupt Extension

For additional technical information, see the Mac OS 7.6.1 Update Technote. You can find it at the Apple Developer World site at <http://devworld.apple.com/dev/technotes.shtml>.

Known problems with Mac OS 7.6.1

- Monitors Control Panel is not included in "Mac OS 7.6.1 base" and "Mac OS 7.6.1 all" extension manager sets
If you have a computer that does not have the Monitors & Sound control panel and you select the "Mac OS 7.6.1 base" or "Mac OS 7.6.1 all" extension manager sets, you will also need to select the Monitors Control Panel.

Known problems with Mac OS 7.6 not fixed with this update

- Connectix Speed Doubler disabled when Mac OS 7.6.1 is installed
There is a problem using Speed Doubler versions 1.3.1 and earlier and version 2.0 with Mac OS 7.6. If you use one of these Speed Doubler versions, it will be disabled after you install Mac OS 7.6.1 Update. Connectix is aware of this problem and is providing a free update. For more information, see the Connectix Web site at <http://www.connectix.com>, or call 800-839-3632.
- Versions of several Apple software products compatible with computers with 68030 and 68040 processors that require the CFM-68K Runtime Enabler not included with Mac OS 7.6
Because of a problem with the CFM-68K Runtime Enabler, the extension and compatible versions of several Apple software products (such as OpenDoc, the LaserWriter 8.4 driver, Apple Telecom software 3.0 and later, and the Apple Media Tool) were not included with Mac OS 7.6. The CFM-68K Runtime Enabler problem has been fixed and computers with 68030 and 68040 processors can now use programs that require this extension. The latest version of this software is available on "Apple SW Updates" on the Internet <http://www.info.apple.com>, America Online (keyword: AppleComputer), and CompuServe (GO APLSUP). To get a list of authorized mirror sites on the Internet, access the following URL: <http://support.info.apple.com/ftp/mirrors.html>
- LaserWriter 8.3.4 results in an error message when you print to a file and then drag the resulting file to a desktop printer
If you use the LaserWriter 8.3.4 driver to print to a file and then drag the resulting file to a desktop printer, you get a message stating that the print library is missing. To work around this problem, update your LaserWriter software to LaserWriter 8.4.1. This software is available on "Apple SW Updates" on the Internet <http://www.info.apple.com>, America Online (keyword: AppleComputer), and CompuServe (GO APLSUP). To get a list of authorized mirror sites on the Internet, access the following

URL: <<http://support.info.apple.com/ftp/mirrors.html>>

- After you install Mac OS 7.6.1 Update, the easy install option no longer works for reinstalling Mac OS 7.6

Once you have installed Mac OS 7.6.1 Update, you can no longer use the easy install option for reinstalling Mac OS 7.6 (installers cannot update over newer versions of software). You must use the clean install option to reinstall Mac OS 7.6. Specific components can be installed using the custom install option.

- Notes on Custom Installs

If you perform a custom install of a component from your Mac OS 7.6 CD (or floppy) and already have system 7.6.1 running on your system, you may notice the following warning dialog: "The file <name of the component> already on <name of your hard drive> is newer than what you are about to install. Click Newer to keep the Newer file, Older to replace that file, or Cancel to stop installation." You should pick Newer.

IMPORTANT: After the Mac OS 7.6 install finishes installing the selected components, you should then reinstall the Mac OS 7.6.1 Update to ensure that the components you just installed are up-to-date.

- Installing QuickDraw GX for use with a non-Apple printer

If you want to use QuickDraw GX with a non-Apple printer, you need to obtain a QuickDraw GX printer driver or remove QuickDraw GX. If QuickDraw GX is installed, you will not be able to use your non-Apple printer without a GX driver. Contact your printer vendor for details. (Turning off QuickDraw GX in the Extensions Manager will solve this problem.)

- Using the QuickDraw GX Installer when Adobe Acrobat is installed

If you use the QuickDraw GX Installer to either install or remove QuickDraw GX and your computer has Adobe Acrobat installed, Acrobat will display a message about missing fonts each time the computer is restarted. Reinstall or turn off Acrobat to stop the warning message. (Turning off QuickDraw GX in the Extensions Manager will not solve the problem.)

- Video Startup extension and Apple Video Player improperly installed by Mac OS 7.6

Mac OS 7.6 improperly installs the Video Startup extension and the Apple Video Player application on Macintosh TV. You should throw the Apple Video Player application and the Video Startup extension in the trash. If these components are present, the Mac OS 7.6.1 Update will update them to newer versions which still do not work on Macintosh TV.

- 3D images cannot be viewed with OpenDoc 3DMF Viewer 1.0.1 with QuickDraw 3D 1.5 or 1.5.1 installed

If QuickDraw 3D 1.5 or 1.5.1 is installed, a message about insufficient memory appears when attempting to place a 3D image in an OpenDoc document. Increasing the viewer's memory size with the Get Info command in the File menu does not solve the problem. To use the 3DMF Viewer,

install an earlier version of QuickDraw 3D.

- Internal speaker on Power Macintosh 5500 and 6500 computers remains muted after disconnecting external speakers
If the external speakers are connected when the computer starts up and then disconnected, the internal speakers remain muted. To work around this problem, restart the computer after disconnecting the external speakers. The internal speaker should work normally.
- Adjusting the volume by pushing the Buttons on the front of the Macintosh LC575 will not register on the Monitors and Sound Control Panel
If you use the front bezel button to change volume on a Macintosh LC575 the change in volume will not register on the "Computer System Volume" slider in the Monitors and Sound control panel. You will only have the Monitors and Sound Control Panel on a LC575 if you have and AppleVision Monitor or are running a universal system.
- Macintosh customers with the DayStar Digital 040 cards will need to do the following:
If you use the DayStar Digital 040 card, you will have to first remove the card, then install Mac OS 7.6.1 Update, and then reinstall the DayStar Digital 040 card
- Two system folders when no desktop printer is selected
If you notice two active system folders on your hard drive, create a desktop printer to work around this problem. To create a desktop printer select the Chooser in the Apple Menu, select any printer, and then press the Create button.

Before you install

Use the Disk First Aid application program before you install the Mac OS 7.6.1 Update to check your hard disk for problems. Disk First Aid comes on the Mac OS 7.6.1 Update, Disk 1 disk and on the Disk Tools disk that came with your computer. Follow these steps:

- 1) Insert the Mac OS 7.6.1 Update, Disk 1 disk into the floppy disk drive.
- 2) Double-click the Disk First Aid icon to open it.
- 3) Click the icon for the disk you are installing software on.
- 4) Click Verify.
- 5) If Disk First Aid tells you your disk appears to be OK, choose Quit from the File menu. If Disk First Aid reports problems with your hard disk, see the manual that came with your computer.

NOTE: If you have a problem using Disk First Aid, see the manual that came with your computer.

Installing Mac OS 7.6.1 Update

Before you install Mac OS 7.6.1 Update, you should have at least 10 MB of disk space temporarily available on your hard disk. It is very important that you follow these steps in order to install Mac OS 7.6.1 Update:

- 1) Open the Extensions Manager control panel.
- 2) Choose "Mac OS 7.6 Base" from the Sets pop-up menu. (This choice will only appear if you are using Mac OS 7.6. If it does not appear, you need to upgrade to Mac OS 7.6 before installing this update.)
- 3) If you have third-party peripheral devices that are required for installation and that require an extension, turn those extensions back on. (Examples include video drivers, drivers for alternative input devices, network card drivers, and drivers for removable media drives, such as CD-ROM drives.)
- 4) Restart your computer.
- 5) Insert the Mac OS 7.6 Update, Disk 1 disk into the floppy disk drive.
- 6) Double-click the Installer icon to open it.
- 7) After you read the licensing agreement, click Agree to continue with the installation.
- 8) Make sure that the destination disk indicated on the screen is the disk that contains Mac OS 7.6. If the wrong disk name appears, click the Switch Disk button until the correct disk name appears.
- 9) Click Install.
- 10) Follow the instructions on the screen. On-screen messages tell you when you need to insert the other disks.
- 11) When the installation is complete, click Restart to restart your computer.
- 12) Use the Extensions Manager to turn on additional extensions.
- 13) To use the extensions you turned on, restart the computer. (If you encounter problems, choose "Mac OS 7.6.1 Base" from the Sets pop-up menu, restart your computer, then turn on other extensions one at a time to determine if one of them is causing the problem.)
- 14) After you install Mac OS 7.6.1 Update, you may want to restart your Macintosh while holding the command () and option key. This will rebuild the desktop on your Macintosh and ensure that no Icons are generic.

IF YOU CANNOT INSTALL THIS UPDATE SUCCESSFULLY: If you have trouble installing this update, try choosing "All Off" from the pop-up menu in Step 2. If you failed to run the Disk First Aid application program, follow the steps in

"Before you install," then follow the steps for installing Mac OS 7.6.1 Update.

Updating a universal System Folder

A universal System Folder can be used to start up any computer that can use Mac OS 7.6.

Only some users need a universal System Folder. You might want to create a universal System Folder if you

- start up different computer models using removable media or an external startup disk
- want to simplify support of multiple users by giving all users the same System Folder

The universal System Folder will not contain

- the Password Security control panel
- ATI 3D Accelerator, ATI MPEG Accelerator, ATI YUV Accelerator, and ATI 6500 Graphics Extension
- ATI Graphics Accelerator 1.2.2 (ATI Graphics Accelerator 1.1.4 is installed in the universal System Folder)
- the Infrared control panel, IrDALib, and IRLanScannerPPC
- the CDStrip control strip module
- the TV/FM 1.5.3

If you are responsible for only one computer, you shouldn't need to create a universal System Folder.

- 1) Start with a universal System Folder created by the Install Mac OS program (available on the CD or floppy disks that came with Mac OS 7.6).
- 2) Update your universal System Folder by installing Mac OS 7.6.1 Update.

Mac OS 7.6.1 Update for PowerBook 3400: Read Me (5/97)

=====

Article Created: 5 May 1997

TOPIC -----

This article is the Mac OS 7.6.1 Update for PowerBook 3400 ReadMe file.

DISCUSSION -----

Overview and Installation

What's included in the Mac OS 7.6.1 Update?

This document contains information on Mac OS 7.6.1 Update for all Power Macintosh and Mac OS Compatible computers, however this installer will only install on the PowerBook 3400.

After you install the Mac OS 7.6.1 Update, you should notice improved stability, as well as the following fixes and enhancements:

- Nearly all Type 11 errors eliminated

Type 11 errors force you to restart the computer without saving your work. Most of these errors are now properly classified as Type 1 or Type 2 errors, which cause the active application to quit, but do not force you to restart the computer. Type 11 errors occur while using "native" applications used by computers with PowerPC processors.

IMPORTANT When you get an error that forces a program to quit, you should still save your work in other open programs and restart the computer.

- Type 112 errors eliminated

Type 112 errors, which occurred when using some multimedia applications, have been eliminated.

- CFM-68K Runtime Enabler included for computers with 68030 and 68040 processors

Computers with 68030 and 68040 processors can now use programs that

require the CFM-68K Runtime Enabler. The CFM-68K Runtime Enabler is a system extension which allows application programs to share code resources. Because of a problem with this extension, it was not included with Mac OS 7.6. This problem has been fixed.

Apple products that use the CFM-68K Runtime Enabler include OpenDoc, the LaserWriter 8.4 driver, Apple Telecom software 3.0 and later, and the Apple Media Tool. Applications from other companies that require the CFM-68K Runtime Enabler include America Online 3.0 and Internet Explorer 3.0. (If you continue to experience problems with non-Apple programs that use the CFM-68K Runtime Enabler, contact the manufacturer.)

- Improved compatibility with serial devices when using Performa 5400 and 6400 and PowerBook 3400 computers

Equipment connected to the serial port now communicates correctly with these computers. (Previously, some devices using the serial port were not recognized by these computers if the devices were connected when the computer started up.)

- Infrared problems fixed on PowerBook 1400 and 3400 computers

The computer no longer freezes if the infrared window is blocked when the computer is starting up or transferring files.

- Improved reliability when using large QuickTime files, or using QuickTime in low-memory situations

Application programs that use QuickTime files work more reliably when working with large files and when using QuickTime files in low-memory situations.

- Printing improved for Performa and Power Macintosh 5400 and 6400 series computers using non-Apple printers over LocalTalk networks

Performa and Power Macintosh 5400 and 6400 computers now print at an acceptable speed on non-Apple printers over a LocalTalk network. (Previously, printing was very slow.)

- Video applications recognize that MPEG is installed

Video applications, including the Apple Video Player, now correctly recognize when MPEG software or hardware is installed.

- Storage PC Cards no longer require a utility program to appear on the desktop
PC Cards used for storage now appear on the desktop when inserted. A mounting utility program is no longer required.

- Only two low-battery messages displayed on PowerBooks before computer shuts itself down

Only two low-battery messages are displayed, instead of three, before the computer shuts itself down. The first message appears approximately two to four minutes before shutdown. The second occurs approximately ten seconds before shutdown.

- PowerBook 1400 computers now wake from sleep faster

When you wake the computer, there is less of a delay before the screen appears.

- Contrast and brightness controls work as expected on PowerBook 1400 computers

The screen will get brighter or show more contrast when the plus (+) controls are pressed. Previously, the functionality of the plus (+) and minus (-)

controls were reversed on PowerBook 1400 computers.

- On the PowerBook 3400, the CD-ROM drive works correctly if inserted when the computer is on

The removable CD-ROM drive now appears correctly on the desktop if it is inserted in the expansion bay while the computer is on.

- New version of Apple System Profiler

IDE-based CD-ROM drives, such as the built-in CD-ROM drive for the PowerBook 1400, are now listed in the Apple System Profiler window.

- New version of AppleVision software

A new version of AppleVision software improves reliability on computers that currently use AppleVision monitors.

- Graphics acceleration software works correctly with a universal System Folder
- Graphics acceleration software now works correctly when used with a universal System Folder. Additionally, the Graphics Accelerator extension and the Graphics Accelerator 2 extension have been merged into the ATI Graphics extension.

- New version of Apple Video Player

All computers can use the AppleScript scripting language to automate tasks in Apple Video Player.

- Settings in Energy Saver control panel are saved properly

Changes made to automatic startup and shutdown settings are now saved.

- Large files copied between IDE hard disks sometimes crashed the system
- Files over 1 MB can now be copied between two IDE hard disks without causing a system crash.

- Better performance when using video-capture expansion cards and ATI accelerators

Video capture is faster on computers when using video-capture PCI expansion cards with ATI graphics accelerators.

Besides the bug fixes provided by Mac OS 7.6.1 Update, several of the bug fixes and features that have been previously released as extensions are now part of the OS. You may notice that these extensions have been removed from the Extensions folder. After installing the Mac OS 7.6.1 Update, you will no longer need these extensions in your Extensions folder.

54xx/64xx Update version 1.0

54xx/64xx Update version 1.1

7.5.5 SCSI Server Update

Assistant Toolbox

PCI Network Legacy Layer version 1.0

PCI Network Legacy Loader version 1.0

PowerBook 1400 ATA Flash

PowerBook 1400 PMU Updater

PowerBook VM Tuner for OS 7.6

PowerMac Format Patch

PowerPC Interrupt Extension

For additional technical information, see the Mac OS 7.6.1 Update Technote. You can find it at the Apple Developer World site at [<http://devworld.apple.com/dev/technotes.shtml>](http://devworld.apple.com/dev/technotes.shtml).

Known problems with Mac OS 7.6.1

Open Transport 1.1.2 and PowerBook 3400

Open Transport 1.1.2 and the PowerBook 3400 are not compatible unless you follow these instructions. Open Transport 1.1.2 was released to address issues with very specific network configurations of some customers, and is not required for most Open Transport users. If you require version 1.1.2 of Open Transport for your network configuration, first install Open Transport 1.1.2, and then immediately install the Mac OS 7.6.1 Update for PowerBook 3400. This will overwrite resources which otherwise could cause crashes when switching between Infrared and LocalTalk.

PowerBook 1400 and Newer Technology Ethernet Card

A PowerBook 1400 used with the Newer Technology Ethernet card requires Ethernet driver version 1.5 or later from Newer Technology. Drivers older than version 1.5 may cause crashes. Visit Newer Technology's web site for the latest version: [<http://newertech.com/software.html>](http://newertech.com/software.html), or call their Tech Support at 1-800-678-3726.

Infrared Control Panel Produces Incorrect Error

If the Infrared control panel is selected on a computer that does not have infrared capability, an error -192 message is displayed. The error should state that Infrared is not supported on this computer.

Printing Speed Improvements

Improved print speed is present for some computers using third party printers over LocalTalk networks, however, Power Macintosh 5400 and 6400 computers with processor speeds less than 200 MHz without an L2 cache still exhibit slow printing. Apple is working on a solution to this problem, and will post a solution as soon possible online in the same locations as this update.

68040Computers and Closed Caption Feature in Apple Video Player

Apple Video Player's Closed Caption option will cause a hang on a 68040 computers with the Apple TV Tuner installed. Reinstalling the Apple Video Player (version 1.4) from the Mac OS 7.6 CD will remedy the problem. To reinstall, launch "Install System Software" in the Mac OS 7.6 folder within the Software Installers folder on the Mac OS 7.6 CD. Choose "Custom Install" from the pop-up, then click on the triangle next to the item "Multimedia" to expand it. Select "Apple Video Player 1.4" and click "Install." When asked if the "Newer" or "Older" file should be used, select "Older."

Apple Video Player & Mac OS 7.6.1 Incompatible with QuickTime MPEG Card

Apple Video Player will not properly recognize a QuickTime MPEG Card when run under Mac OS 7.6 or Mac OS 7.6.1. With Mac OS 7.6.1 the QuickTime MPEG extension can be used to view MPEG files using software decompression with Apple Video Player.

Apple Video Plaer 1.6 is not Installed on PowerBook 3400

If you need to use this application program, it can be downloaded from
<<http://www.info.apple.com>>.

Power Macintosh 7100/80AV & Apple Video Player Sound Problems

If the sound is muted and the slider doesn't work in Apple Video Player on a 7100/80AV, open Apple Video Player and click on the mute button to activate it. Quitting and relaunching the Apple Video Player should then remedy the problem.

Mac OS 7.6.1 and AppleVision 1710: Missing Colorsync Profile

If you try to import the "AppleVision 1710-9300" ColorSync profile, and the error "Could not complete your request because a ColorSync error has occurred." appears, install AppleVision 1.5.1 to eliminate the problem.

Extensions Manager Mac OS 7.6.1 Sets Omit File Needed to Print

Selecting "Mac OS 7.6.1 Base" and "Mac OS 7.6.1 All" in Extensions Manager, mistakenly turns off "Printing Lib" and printing is disabled. Manually turning on "Printing Lib" within Extensions Manager after choosing one of these sets will allow printing.

Extensions Manager Mac OS 7.6.1 Sets Omit Monitors Control Panel

Selecting "Mac OS 7.6.1 Base" and "Mac OS 7.6.1 All" in Extensions Manager, mistakenly turns off "Monitors" control panel. Manually turning on "Monitors" within Extensions Manager after choosing one of these sets will allow access to this control panel.

Internal Speaker on Power Macintosh 5500 and 6500 Remain Muted

If external speakers are connected to a Power Macintosh 5500 or 6500 when the computer starts up and are then disconnected, the internal speakers remains muted. Restart the computer after disconnecting the external speakers and the internal speaker will work normally.

VM is not Turned on for 68030 & 68040 Computers with More Than 16 MB of RAM 68030- and 68040-based Macintosh computers with more than 16 MB of physical memory do not have Virtual Memory turned on after installing Mac OS 7.6.1 Update.

Known problems with Mac OS 7.6 not fixed with this update

- Connectix Speed Doubler disabled when Mac OS 7.6.1 is installed

There is a problem using Speed Doubler versions 1.3.1 and earlier and version 2.0 with Mac OS 7.6. If you use one of these Speed Doubler versions, it will be disabled after you install Mac OS 7.6.1 Update. Connectix is aware of this problem and is providing a free update. For more information, see the Connectix Web site at <<http://www.connectix.com>> or call 800-839-3632.

- Versions of several Apple software products compatible with computers with 68030 and 68040 processors that require the CFM-68K Runtime Enabler not included with Mac OS 7.6

Because of a problem with the CFM-68K Runtime Enabler, the extension and compatible versions of several Apple software products (such as OpenDoc, the LaserWriter 8.4 driver, Apple Telecom software 3.0 and later, and the Apple Media Tool) were not included with Mac OS 7.6. The CFM-68K Runtime Enabler problem has been fixed and computers with 68030 and 68040 processors can now use

programs that require this extension. The latest version of this software is available on "Apple SW Updates" on the Internet <<http://www.info.apple.com>>, America Online (keyword: AppleComputer), and CompuServe (GO APLSUP). To get a list of authorized mirror sites on the Internet, access the following URL: <<http://support.info.apple.com/ftp/mirrors.html>>

- LaserWriter 8.3.4 results in an error message when you print to a file and then drag the resulting file to a desktop printer
If you use the LaserWriter 8.3.4 driver to print to a file and then drag the resulting file to a desktop printer, you get a message stating that the print library is missing. To work around this problem, update your LaserWriter software to LaserWriter 8.4.1. This software is available on "Apple SW Updates" on the Internet <<http://www.info.apple.com>>, America Online (keyword: AppleComputer), and CompuServe (GO APLSUP). To get a list of authorized mirror sites on the Internet, access the following URL: <<http://support.info.apple.com/ftp/mirrors.html>>

- After you install Mac OS 7.6.1 Update, the easy install option no longer works for reinstalling Mac OS 7.6

Once you have installed Mac OS 7.6.1 Update, you can no longer use the easy install option for reinstalling Mac OS 7.6 (installers cannot update over newer versions of software). You must use the clean install option to reinstall Mac OS 7.6. Specific components can be installed using the custom install option.

- Notes on Custom Installs

If you perform a custom install of a component from your Mac OS 7.6 CD (or floppy) and already have system 7.6.1 running on your system, you may notice the following warning dialog: "The file <name of the component> already on <name of your hard drive> is newer than what you are about to install. Click Newer to keep the Newer file, Older to replace that file, or Cancel to stop installation." You should pick Newer.

IMPORTANT After the Mac OS 7.6 install finishes installing the selected components, you should then reinstall the Mac OS 7.6.1 Update to ensure that the components you just installed are up-to-date.

- Installing QuickDraw GX for use with a non-Apple printer

If you want to use QuickDraw GX with a non-Apple printer, you need to obtain a QuickDraw GX printer driver or remove QuickDraw GX. If QuickDraw GX is installed, you will not be able to use your non-Apple printer without a GX driver. Contact your printer vendor for details. (Turning off QuickDraw GX in the Extensions Manager will solve this problem.)

- Using the QuickDraw GX Installer when Adobe Acrobat is installed

If you use the QuickDraw GX Installer to either install or remove QuickDraw GX and your computer has Adobe Acrobat installed, Acrobat will display a message about missing fonts each time the computer is restarted. Reinstall or turn off Acrobat to stop the warning message. (Turning off QuickDraw GX in the Extensions Manager will not solve the problem.)

- Video Startup extension and Apple Video Player improperly installed by Mac OS 7.6

Mac OS 7.6 improperly installs the Video Startup extension and the Apple Video

Player application on Macintosh TV. You should throw the Apple Video Player application and the Video Startup extension in the trash. If these components are present, the Mac OS 7.6.1 Update will update them to newer versions which still do not work on Macintosh TV.

- 3D images cannot be viewed with OpenDoc 3DMF Viewer 1.0.1 with QuickDraw 3D 1.5 or 1.5.1 installed

If QuickDraw 3D 1.5 or 1.5.1 is installed, a message about insufficient memory appears when attempting to place a 3D image in an OpenDoc document. Increasing the viewer's memory size with the Get Info command in the File menu does not solve the problem. To use the 3DMF Viewer, install an earlier version of QuickDraw 3D.

- Macintosh customers with the DayStar Digital 040 cards will need to do the following:

If you use the DayStar Digital 040 card, you will have to first remove the card, then install Mac OS 7.6.1 Update, and then reinstall the DayStar Digital 040 card

- Two system folders when no desktop printer is selected

If you notice two active system folders on your hard drive, create a desktop printer to work around this problem. To create a desktop printer select the Chooser in the Apple () Menu, select any printer, and then press the Create button.

Before you install

Use the Disk First Aid application program before you install the Mac OS 7.6.1 Update to check your hard disk for problems. Disk First Aid comes on the Mac OS 7.6.1 Update, Disk 1 disk and on the Disk Tools disk that came with your computer. Follow these steps:

1. Insert the Mac OS 7.6.1 Update, Disk 1 disk into the floppy disk drive.
2. Double-click the Disk First Aid icon to open it.
3. Click the icon for the disk you are installing software on.
4. Click Verify.
5. If Disk First Aid tells you your disk appears to be OK, choose Quit from the File menu. If Disk First Aid reports problems with your hard disk, see the manual that came with your computer.

Note: If you have a problem using Disk First Aid, see the manual that came with your computer.

Installing Mac OS 7.6.1 Update

Before you install Mac OS 7.6.1 Update, you should have at least 10 MB of disk space temporarily available on your hard disk.

It is very important that you follow these steps in order to install Mac OS

7.6.1 Update:

1. Open the Extensions Manager control panel.
2. Choose "Mac OS 7.6 Base" from the Sets pop-up menu. (This choice will only appear if you are using Mac OS 7.6. If it does not appear, you need to upgrade to Mac OS 7.6 before installing this update.)
3. If you have third-party peripheral devices that are required for installation and that require an extension, turn those extensions back on. (Examples include video drivers, drivers for alternative input devices, network card drivers, and drivers for removable media drives, such as CD-ROM drives.)
4. Restart your computer.
5. Insert the Mac OS 7.6 Update, Disk 1 disk into the floppy disk drive.
6. Double-click the Installer icon to open it.
7. After you read the licensing agreement, click Agree to continue with the installation.
8. Make sure that the destination disk indicated on the screen is the disk that contains Mac OS 7.6. If the wrong disk name appears, click the Switch Disk button until the correct disk name appears.
9. Click Install.
10. Follow the instructions on the screen. Onscreen messages tell you when you need to insert the other disks.
11. When the installation is complete, click Restart to restart your computer.
12. Use the Extensions Manager to turn on additional extensions.
13. To use the extensions you turned on, restart the computer. (If you encounter problems, choose "Mac OS 7.6.1 Base" from the Sets pop-up menu , restart your computer, then turn on other extensions one at a time to determine if one of them is causing the problem.)
14. After you install Mac OS 7.6.1 Update, you may want to restart your Macintosh while holding the command () and option key. This will rebuild the desktop on your Macintosh and ensure that no Icons are generic.

If you cannot install this update successfully: If you have trouble installing this update, try choosing "All Off" from the pop-up menu in Step 2. If you failed to run the Disk First Aid application program, follow the steps in "Before you install," then follow the steps for installing Mac OS 7.6.1 Update.

Updating a universal System Folder

A universal System Folder can be used to start up any computer that can use Mac OS 7.6.

Only some users need a universal System Folder. You might want to create a universal System Folder if you

- start up different computer models using removable media or an external startup disk
- want to simplify support of multiple users by giving all users the same System Folder

The universal System Folder will not contain

- the Password Security control panel
- ATI 3D Accelerator, ATI MPEG Accelerator, ATI YUV Accelerator, and ATI 6500 Graphics Extension
- ATI Graphics Accelerator 1.2.2 (ATI Graphics Accelerator 1.1.4 is installed in the universal System Folder)
- the Infrared control panel, IrDALib, and IRLanScannerPPC
- the CDStrip control strip module
- the TV/FM 1.5.3

If you are responsible for only one computer, you shouldn't need to create a universal System Folder.

1. Start with a universal System Folder created by the Install Mac OS program (available on the CD or floppy disks that came with Mac OS 7.6).
2. Update your universal System Folder by installing Mac OS 7.6.1 Update.

Power Macintosh: Level 2 Cache Modules Supported (5/97)

=====

Article Created: 5 May 1997

TOPIC -----

I have a Power Macintosh 7300. It came with a 256K Level 2 cache module. I would like to upgrade the Level 2 cache.

Page 99 of the User's Guide states, "You can replace the existing cache module with a larger one. Cache modules are currently available from third-party manufacturers in various sizes up to 1 MB. However, Apple recommends that you use an Apple-brand cache module if you want to upgrade your existing cache."

Apple does not sell or support cache modules larger than 256K. How do I upgrade my cache with an Apple-brand cache if Apple does not sell one? Is there a third-party manufacturer that Apple recommends?

DISCUSSION -----

The statement in the User's Guide can cause confusion. Apple does not sell or support a Level 2 cache module larger than 256K.

A number of Power Macintosh systems have been designed and built to theoretically accept Level 2 cache modules larger than 256K. However, the design, testing, sale and technical support of such modules is entirely up to third-party manufacturers.

Apple Computer does not endorse a particular brand of Level 2 cache.

TITLE

Performa w/GeoPort: Restore Modem SW & Clean 7.6
Install

Article ID: 22048
Created: 6/16/97
Modified: 11/13/97

TOPIC

I have a Performa 6360 or 6400; or a Power Macintosh 4400 or 6500 system with a software bundle. I performed a clean install of Mac OS 7.6 and/or 7.6.1. Now my internal GeoPort modem does not work. What should I do?

Note:: For the purposes of the following discussion, Clean Install means placing a new System Folder on the hard disk. It does not mean reformatting the hard disk. Clean system software installations can be done automatically, through the 7.6 and/or 7.6.1 installer in which case the previous System Folder is renamed to "Previous System Folder".

DISCUSSION

Mac OS 7.6 and/or 7.6.1 does not include GeoPort software, or most of the third-party software which came bundled with your computer. Installers are not available to automatically install this software; therefore, you have two options:

1. Perform a clean install of the original bundled Performa software, then conduct a Restore All Software operation, then re-install Mac OS 7.6 and/or 7.6.1.
2. Drag-copy the extra elements from the old System Folder or from your Macintosh Performa CD to your hard disk.

Important: The following steps only apply to the listed systems. Apple does not support drag-installing Apple Telecom software on other computer types or with previous versions of the Mac OS.

Option 1: Clean Install and Re-Install Mac OS 7.6 and/or 7.6.1

For the first option, perform the following steps:

1. View Tech Info Library (TIL) document 17768: **System SW Clean Restore: Macintosh Performa Computers w/CD**
2. Perform the instructions in the article mentioned above, even if you have already installed Mac OS 7.6 and/or 7.6.1. Choose Restore All Software when finished. This will re-install the original system software, and all third-party software.
3. Install Mac OS 7.6 and/or 7.6.1. If you added Mac OS 7.6.1 after installing Mac OS 7.6, you will need to install Mac OS 7.6 first, then apply the Mac OS 7.6.1 Update.

After installing Mac OS 7.6.1, you are finished. You will need to then reconfigure your various third-party applications.

Option 2: Drag-Copy Necessary Software From Another System Folder

The rest of this article deals with drag-installing software from your Previous System Folder or from your Macintosh Performa CD. There are various steps involved, therefore this approach is best used by experienced Macintosh users or system administrators.

Before proceeding, understand why you are doing this. Did you perform the clean install because you were troubleshooting an extensions or control panel conflict? If so, it would be a good idea to see if your new System Folder resolved the issue before adding extraneous control panels or extensions. If you are troubleshooting a problem, use caution. There are many Tech Info Library articles describing the purpose and mechanics of a clean install; many are tailored to specific systems. Perform a search using the search string "clean install" to get a list of these articles.

The following steps are mainly intended for users who like to install "sterile" system software, but who want control over the extra functionality that is available with the Performa version of System 7.5.3. The idea in the steps is to use either your Previous System Folder, or the pristine System Folder on your Macintosh Performa CD to dragging the data (files) from

If you choose to copy from your Macintosh Performa CD -- this is the preferred option -- the relevant files can be found in Hard Disk Files -> System Folder. If you are troubleshooting, you should probably not choose to copy from your Previous System Folder. However if you are not troubleshooting, and you choose to copy from your Previous System Folder, the relevant files are in the Preferences Folder. You should note that sometimes corrupted preferences files can cause problems.

Note: The following is solely intended for the Performa 6360/6400 and Power Macintosh 4400/6500 Small Business/Family Macintosh bundles that ship with GeoPort modems. Since product specifications can and do change without notice, Apple cannot guarantee that this article will keep pace with changes in the bundles for these computers. Therefore, some aspects of the following discussion may not specifically apply to your computer.

The following assumes you did an Easy Install of 7.6 and/or 7.6.1 in conjunction with the clean install process. If you did a Custom Install or Minimum Install, resources needed for the proper functioning of various software packages may not be present. The resulting behavior will range from system crashes to packages refusing to open.

Also, third-party applications, you purchased, may have their own requirements. If you find that these applications no longer work correctly, or look different, certain preferences may be absent, or extensions may not have been transferred. Your options are to either identify which items are missing and move them from the Previous System Folder to the new System Folder, or to simply re-install and re-configure these applications. Check with the application manufacturer if you are dealing with any critical data which you cannot afford to lose.

If you have a third-party printer, you will need to re-install its software from the disks that came with the printer.

Important: Do not throw away your Previous System Folder until you are absolutely certain that everything is working correctly. You may want to keep the Previous System Folder on your hard disk from two to four weeks to make sure that nothing valuable is left in it.

How to proceed

Identify which source you wish to use (your CD or your Previous System Folder), then drag the files, described below, from the source to the equivalent location in the new System Folder. For example, copy the Express Modem control panel from the CD as shown in the path below:

- Hard Disk files: System Folder files: Control Panels: Express Modem

to the same location on your computer's hard disk, using the path below:

- <name of your hard disk>: System Folder: Control Panels: Express Modem

Do not copy folders unless they are not present in the destination. For example, the Mimetics folder is not going to be in the new Mac OS 7.6 and/or 7.6.1 System Folder, so put that there.

GeoPort software (Do this first)

This provides basic modem functionality. If you do not have this, you cannot use the modem.

System Folder:Control Panels:Express Modem

System Folder:Preferences:Cypress

System suitcase

The System suitcase contains "ring" sounds which are used by MegaPhone and the Apple Telecom software. Open the System suitcase in the source System Folder and drag the individual "ring" sounds to the new System Folder and drop them into the System suitcase. You can verify what the sounds are like by double-clicking on them.

Apple Internet Connection Kit (AICK)

AICK is a collection of applications. However, there are some system-level extensions which some of these applications require. The following assumes you are using an "out of box" AICK environment, and that you have not added your own PPP client.

System Folder:Control Panels:Config PPP (Config PPP may not be present here; if it's not, it's OK)

System Folder:Extensions:Internet Config

System Folder:Extensions:PPP

Preferences (these should be dragged from your old System Folder **)

System Folder:Preferences:Internet Dialer folder

System Folder:Preferences:Internet Preferences

System Folder:Preferences:PPP Preferences

System Folder:Preferences:TCP/IP Preferences***

If you have installed OT/PPP, we recommend that you re-install OT/PPP from the original installer. Your preferences, after installation, can be found in

System Folder:Preferences:Remote Access

** Many Internet clients, like Netscape, store their preferences, including their bookmark files, in a folder bearing their name. This folder is also usually stored in the Preferences folder (exceptions include applications like Claris eMailer, which store them inside the application folder). You will need to determine what steps to take on a case-by-case basis. Please contact the manufacturer of the software if you need assistance.

*** Your computer originally ran Classic Networking. Mac OS 7.6 and/or 7.6.1, however, uses an networking architecture called Open Transport. Open Transport was available as an option under Mac OS 7.5.3 or 7.5.5. If you have an account with an Internet Service Provider, and did not already switch over to Open Transport while still running Mac OS 7.5.3 or 7.5.5, you will need to re-enter the information you originally entered into the Apple Internet Dialer or MacTCP. To do this, you will need to use the TCP/IP control panel. Please consult the setup information given to you by your ISP, or contact your ISP for further assistance.

TITLE

Mac OS 8: Clean install instructions for Performa
Computers

Article ID: 22065
Created: 9/3/97
Modified: 9/2/98

TOPIC

This article describes performing a clean installation on a Performa computer.

DISCUSSION

Mac OS 8 installers do not install GeoPort software, or most third-party software which came bundled on the Performa product line. You must perform a clean installation of the original bundled software, then install Mac OS 8.

Follow these steps to perform a clean installation on any of the Performa systems. Additional information can be obtained from the Tech Info Library Article 17768: "**System SW Clean Restore: Macintosh Performa Computers w/CD**":

1. Restart From the Apple Performa CD by pressing and holding the "C" key immediately after powering on your Performa computer.
2. Run the Disk First Aid application.
3. Disable the System Folder. To disable the system folder move either the System, or Finder files from the System Folder. Once one or both of these file are removed rename the System Folder to something like "Storage".
4. Restore original software bundle by clicking Restore All Software in the Launcher.
5. Verify the newly installed system software works by restarting your computer from the hard disk.
6. Choose the Chooser from the Apple menu and make AppleTalk active. This eliminates problems from occurring when starting from the Mac OS 8 CD-ROM disc.
7. Insert the Mac OS 8 CD-ROM and restart the Performa. After you hear the startup chime, press and hold the "C" key.
8. Install Mac OS 8.
9. If you are using an Apple GeoPort modem, you should also updating the Telecom software to version 3.1.3 which can be found on the Mac OS 8 CD-ROM disc. The path to this software on the CD is: Mac OS 8 ->CD Extras ->Apple Telecom ->GeoPort/Express Modems ->Net Install ->Apple Telecom Disk 1 ->Installer. Once the installer has been launched, perform a custom installation by selecting the appropriate software for your GeoPort that is internal or external, Fax software, and the Apple Address Book. The reasoning for this is to keep Apple Phone from being installed. Apple Phone and Megaphone conflict so by not installing Apple Phone, you can avoid further issues.

Mac OS 8.0: Dropping DA Suitcase on System Folder Works

TOPIC

TOPIC

This article describes the behavior of Mac OS 8.0 when a suitcase containing a desk accessory is dropped onto the System Folder.

DISCUSSION

The behavior when dropping a suitcase containing a desk accessory on top of the System Folder has changed with Mac OS 8.0.

Under Mac OS 8.0, if you drop a desk accessory suitcase on top of the System Folder the entire suitcase will automatically move to the Apple Menu Items folder. With System 7.5 and Mac OS 7.6 the desk accessory was removed from the suitcase and put in the Apple Menu Items folder, and the suitcase was deleted.

The change was not intentional; a future release of the system software will likely change this behavior.

Mac OS 8: Clean Install Message

TOPIC

If I select a clean install in the Mac OS 8 Installer and switch to the Finder and back, I get the message "The clean install option was reverted to an update install. Please click Options if you wish to change this option." I encountered this error when I launched the Mac OS 8 Installer but found that I did not have enough free space to install Mac OS 8. I switched to the Finder to free up the space and switched back and got this message.

DISCUSSION

Ever since the clean install option was added to the Installer application (not the "Install Mac OS 8" application), the Installer has always reverted back to a standard installation if the user changed the destination volume or switched to another application.

This is annoying, but allowed Apple to implement the clean install feature in the available time. Prior to Mac OS 7.6, the Installer just silently reverted and left it up to the user to notice that the Clean Install button had changed to Install. For Mac OS 7.6, Apple decided to alert the user to this change by presenting the alert you see.

The easiest way enable the clean install option again is to click Options in the Installer application (not the "Install Mac OS 8" application), and choose Install New System Folder. If the Installer is quit and then restarted, using the "Install Mac OS 8" application, the clean install option will be enabled once again.

We expect to change this behavior in a future release of system software.

Mac OS 8: Late Breaking Information

Subject: Mac OS 8: Late Breaking Information

TOPIC

This article includes late-breaking information regarding Mac OS 8 (as of August 6, 1997). For up-to-the-minute information, check the "Late Breaking Information" area of the Mac OS web site at <http://macos.apple.com/macos/latebreak/>

DISCUSSION

Installer Alias does not work to the Geoport/Express Modems Installer on the Mac OS 8 CD

The error: "The alias Installer could not be opened because the original item cannot be found" will appear if the icon is opened.

Workaround: The correct installer application can be found two folders down in: Net Install: Apple Telecom - Disk 1. Selecting the Installer alias, and choosing Get Info from the File menu will display the correct path.

Cannot Boot from Mac OS 8 CD When AppleTalk is Off

Some customers have reported that they are unable to boot from the Mac OS 8 Install CD. During the startup process, a dialog appears with the following message: 'Sorry, a system error has occurred. Bus Error Type 11. Restart with shift key held down.' This issue is currently under investigation.

Possible Workarounds (Not all of them may be necessary):

Make sure the computer is running from the startup disk. Activate AppleTalk (in the Chooser for classic networking, or in the AppleTalk control panel for Open Transport networking). With the Mac OS 8 CD in the CD-ROM drive, restart the computer while holding down the 'c' key.

With the Mac OS 8 CD in the CD-ROM drive, startup your computer, while pressing the letter 'c' (or cmd-opt-shift-del if appropriate). When the Happy Macintosh icon appears, release all keys and hold down the shift key until the boot screen appears with the 'extensions disabled' message.

Using the Mac OS 8 CD, create a startup Disk Tools disk. To make a Disk Tools disk, open the Disk Tools folder on the Mac OS 8 CD, then open the Make Disk Tools floppies application. When you startup from the Disk Tools disk, you will then be able to run the Mac OS 8 Installer from the CD. (This will only work with Apple CD-ROM drives).

Use the Extensions Manager to select a minimum (base) set of the Mac OS extensions. Boot from the hard disk and install from the Mac OS 8 CD. If the installer finds any problems with the hard disk, it will not be able to correct them.

Clear (zap) the Parameter RAM (PRAM). After doing this, restart holding down the 'c' key to start up from the Mac OS 8 Install CD.

No Compatibility Issues With Mac OS 8 and Personal Web Sharing

The Read me for Personal Web Sharing (posted separately on the Internet) incorrectly states that there are compatibility problems, and this misinformation has been posted on other web sites.

There are no known incompatibilities with Mac OS 8 and Personal Web Sharing. There is no need to turn off Virtual Memory (VM), nor is there an issue with the PCI Enet driver.

Intermittent Problem Copying a Large Number of Files in Low Memory Situation

Apple has identified an intermittent problem with Mac OS 8 relating to copying large number of files between volumes when memory is low. If memory is low and a very large copy is performed between two local volumes or a local volume and a shared volume, all items may not be copied correctly and no indication is given. The size of the copy necessary to produce the bug is related to how little memory remains when the copy is started but the problem most often

occurs with copies
of more than several thousand items. Apple is working on a fix for this problem.

Workaround: Make sure several megabytes of memory is available before starting a large copy and
copy fewer files at a time. To verify that the problem has not occurred, compare the number of items
in the result with that in the source. Select the source and result and select Get Info from the File
menu. Compare the number of items shown in the Size field. If the number are the same, the copy
finished correctly. Note that the total sizes may differ depending on the size of the source and
destination volumes. Different total sizes do not indicate a problem with the copy.

Starting a 68040 computers from a CD-ROM using the c key depressed or
"command-option-shift-delete" does not work when the SCSI-ID is 5

Typically, to start up using a bootable CD, holding down the "c" key
or "command-option-shift-delete"
will force the computer to ignore the default startup volume, and boot from the CD in the CD-ROM
drive. This will not work on 68K machines if your CDdrive is set to SCSI-ID 5. The computer will
chime, and display the sad Mac, which usually denotes a hardware problem.

Workaround: Select the CD as the startup disk in the Startup control panel or set the SCSI-ID to
anything but 5 will work around this problem. Note: internal CD drives shipped from Apple are not
set to SCSI-ID 5.

In a pop-up window, selecting make alias or duplicate from the contextual menu (Control-click)
will cause a system crash

Workaround: Selecting "make alias" from the menu, and using the contextual menu when not in a
pop-up window work correctly. Option-dragging the file also works correctly.

Duplication of a folder with more than 20 items on a remote server can unexpectedly fail

When a folder with more than 20 items in it is duplicated, sometimes the copy will not complete, and
no indication is given to the user. The copy failure can depend on the size of the files, and the order
they are copied (which is dependent on the B-tree). The problem results in the process being put to
sleep, and thus neither machine is doing anything. Neither machine is hung nor inoperative, and the
copy can be terminated from the workstation by clicking the Stop button.

Workaround: Workarounds include copying the folder to another volume and back again; copying less than 20 files at a time; compressing the files into one large file, duplicating, and decompressing them again. Copying the folder to another volume will always work, the problem only occurs when duplicating some folders on another machine over a network.

MBDF virus infection can result in visual defects when the "System-wide platinum appearance" is turned off

On a virus infected machine with the System-wide platinum appearance check box unchecked in the Appearance control panel, visual defects such as problems in menus, menu items that were white turning grey when the mouse tracks over them. This indicates that the system has probably been infected with the MBDF virus. This virus causes no problems other than this color discrepancy, but should be removed by a virus removal utility.

Workaround: Use a virus utility to disinfect your computer.

Adobe Type Manager (ATM) v 4.0.2 Installation Instructions

The latest version of Adobe Type Manager, version 4.0.2, is included with Mac OS 8. Previous versions of ATM did not load properly when running the new QuickDraw GX Graphics extension. ATM version 4.0.2 addresses this problem.

Note: This version of ATM is not compatible with ATM Deluxe version 4.0. If you are running ATM Deluxe, do not install this updated version ATM 4.0.2.

To install ATM 4.02, you need to run the QuickDraw GX Installer located in the folder QuickDraw GX in the Software Installers folder. Here are the steps:

1. Double-click Install QuickDraw GX
2. From the main installer screen click on the Easy Install pop-up menu.
3. Select Custom Install.
4. Select ATM for QuickDraw GX.
5. Click the Install button.
6. At the end of the installation you will need to restart your computer.

Incorrect Version of Dial-up Application for MacLink Plus 9.0

The incorrect version of the automatic dial-up registration application for MacLinkPlus 9.0 was

included on the Mac OS 8 CD. The International version was included instead of the U.S. version.

U.S. customers who want to register MacLinkPlus 9.0 electronically can do so by visiting DataViz at:

<http://www.dataviz.com/register>. Customers can also register by printing out the registration form, and mailing it to DataViz using the address found in the 'Contacting DataViz' file.

Mac OS Runtime for Java version 1.5 Now Available

Apple has released version 1.5 of the Mac OS Runtime for Java. This is a major update that includes

performance enhancement technology that can run your Java applets and applications up to 10

times faster. You can download your copy from our "Apple and Java" site:

<http://software.apple.com/mrj/>

Now Utilities Not Fully Compatible with Mac OS 8

Now Software is evaluating the situation and will announce their plans in the near future. In the

meantime, they recommend

that you do not install Now Utilities with Mac OS 8 or if you do, that you do so at your own risk.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible

for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular

vendor's address and phone number.

Mac OS 8: Limitations of Desktop Pictures Control Panel

TOPIC

This article contains the following frequently asked questions (FAQ) about the Desktop Pictures control panel that is part of Mac OS 8, and answers to those questions.

- 1) Which file formats (such as GIF, JPEG, PICT, EPS) does Desktop Pictures support?
- 2) What are the the size limitations of pictures imported for use as a desktop picture? Are the size and number of pictures limited by available memory or is there a hard-coded limitation?

DISCUSSION

1) Question: Which file formats (such as GIF, JPEG, PICT, EPS) does Desktop Pictures support?

Answer: Desktop Pictures supports the following image formats:

- files supported by QuickTime 2.5 graphics import components including JPEG, GIF and PhotoShop
- QuickTime Compressed 'PICT'
- 'PICT'
- picture clippings

2) Question: What are the the size limitations of pictures imported for use as a desktop picture?
Are the size and number of pictures limited by available memory or is there a hard-coded limitation?

Answer: The use of the term "imported" is not quite proper. The pictures are not

absorbed by any preference file or the Desktop Pictures control panel itself. The pictures remain as separate individual files, with a reference to them in the Desktop Pictures Prefs file.

There are no known limits on dimensions or bit depth for the pictures displayed with Desktop Pictures.

The "number of pictures" has two interpretations. The number of pictures available to display and the number of pictures actually displayed in a multi-monitor configuration.

The number of pictures available to display is subject to theoretical file system limitations of files in a folder and practical limitations of number of files that can be displayed in the open file dialog by the List Manager.

The number of pictures actually displayed in a multi-monitor configuration would be constrained by available RAM. Desktop Pictures stores the picture in temporary memory. Thus, if you have sufficient free RAM, the picture stays in RAM and redraw happens quickly. If you launch an application that needs that temporary memory, the picture is read from disk and redraw happens much more slowly.

TITLE

Power Macintosh G3: Technical Information Guide

Article ID: 24213
Created: 11/12/97
Modified: 1/11/00

TOPIC

This article contains the information published in the Power Macintosh G3 Technical Information Guide, which is included with every Power Macintosh G3 desktop system.

DISCUSSION

Processor

266 megahertz (MHz) PowerPC 750 processor/66 MHz system bus
233 megahertz (MHz) PowerPC 750 processor/66 MHz system bus
300 megahertz (MHz) PowerPC 750 processor/66 MHz system bus

Memory

Dynamic Random Access Memory

The computer comes with 32 megabytes (MB) of synchronous dynamic random-access memory (SDRAM), supplied in removable Dual Inline Memory Modules (DIMMs). The main logic board has three expansion slots, which accept DIMMs that meet these specifications:

- 8, 16, 32, 64, or 128 MB DIMMs
- DIMMs must be 3.3 volt (V), unbuffered, 64-bit wide, 168-pin
- 100 MHz/10 nanosecond (ns) cycle time or faster using Synchronous Dynamic Random Access Memory (SDRAM).

Note: If you install DIMMs with different speeds, they will all operate at the speed of the slowest DIMM installed.

Important: Power Macintosh G3 series computers use Synchronous Dynamic Random Access Memory (SDRAM) DIMMs. DIMMs from older Macintosh computers are not compatible with your computer and should not be used even though they will fit into the DRAM DIMM slots.

To increase DRAM to the maximum of 384 MB, fill all three slots with 128 MB DIMMs.

(Note: *The printed version of the Technical Information Guide does not contain this additional information: a Power Macintosh G3 in a desktop enclosure is capable of taking 128MB DIMMs. However, smaller 128MB DIMMs must be used due to space constraints. For additional information, refer to Tech Info Library article 24343, "[Power Macintosh G3 \(Desktop\): 128MB Memory DIMM Support](#)".*)

Video Memory

Your computer comes with 2 MB of Synchronous Graphic RAM (SGRAM) video memory built into the logic board. The logic board contains a video memory expansion slot that accepts a DIMM to increase video memory up to a maximum of 6 MB. The DIMM must meet these specifications:

- 2 MB or 4 MB SGRAM SO-DIMM.
- DIMM must be 32-bit wide, 144-pin
- DIMM must have 83 MHz/12 ns cycle time or faster

Important: Use only SGRAM SO-DIMMS and never use 256K or 512K video memory DIMMs used in older Macintosh computers.

Other Memory:

- 4 MB of read-only memory (ROM)
- 8 kilobytes (KB) of nonvolatile parameter memory
- 512K to 1 MB of static RAM used as a level 2 cache integrated into the processor module

For more information and instructions on expanding your DRAM or video memory, see Chapter 3, "Installing PCI Expansion Cards and Additional Memory," in Setting Up Your Power Macintosh G3 series computer manual.

Graphics Modes

The table that follows shows the modes available for monitors that can be connected to the monitor port, along with the number of colors or grays supported with 2 MB of video memory (SGRAM) and with the optional expansion to 4 MB or 6 MB of SGRAM. The table also lists the screen refresh rates in hertz (Hz) and kilohertz (kHz). Peripheral component interconnect (PCI) expansion cards that can support other monitors and special video requirements are available from other manufacturers. See your Apple-authorized dealer for information.

Note: On some monitors from manufacturers other than Apple, the connector pinout designates one pin for both green video and timing synchronization. These "sync on green" monitors are not compatible with Power Macintosh computers. If you're not sure what type of monitor you have, check with your dealer.

You can use the Monitors & Sound control panel or the Control Strip to set a display mode that is supported by both your monitor and the built-in video circuitry. Refer to the manual that came with your monitor for a list of display modes that it supports.

Display Modes and Color Depths						
Display Mode	Screen Refresh Rate		Clock	Pixel Color Depth (bits per pixel)*		
(resolution)	vertical	horizontal		2MB	4MB	6MB
512 x 384	70.130 Hz	31.488 kHz	21.160	32	32	32
640 x 480	59.940 Hz	31.469 kHz	25.175	32	32	32
640 x 480	66.667 Hz	35.000 kHz	30.24	32	32	32
640 x 480	72.809 Hz	37.861 kHz	31.500	32	32	32
640 x 480	75.000 Hz	37.500 kHz	31.500	32	32	32
640 x 480	85.008 Hz	43.269 kHz	36.000	32	32	32
640 x 870	75.000 Hz	68.850 kHz	57.283	16	32	32
800 x 600	56.250 Hz	35.156 kHz	36.000	32	32	32
800 x 600	60.317 Hz	37.879 kHz	40.000	32	32	32
800 x 600	72.188 Hz	48.077 kHz	50.000	32	32	32
800 x 600	75.000 Hz	46.875 kHz	49.500	32	32	32
800 x 600	85.061 Hz	53.674 kHz	56.250	32	32	32
832 x 624	74.550 Hz	49.725 kHz	57.283	32	32	32
1024 x 768	60.004 Hz	48.363 kHz	65.000	16	32	32
1024 x 768	70.069 Hz	56.476 kHz	75.000	16	32	32
1024 x 768	75.029 Hz	60.023 kHz	78.750	16	32	32
1024 x 768	74.927 Hz	60.241 kHz	80.000	16	32	32
1024 x 768	84.997 Hz	68.677 kHz	94.500	16	32	32
1152 x 870	75.062 Hz	68.681 kHz	100.00	16	32	32
1280 x 960	75.000 Hz	75.000 kHz	126.000	8	16	16
1280 x 1024	60.020 Hz	63.981 kHz	108.000	8	16	32
1280 x 1024	75.025 Hz	79.976 kHz	135.000	8	16	16
1280 x 1024	85.024 Hz	91.146 kHz	157.500	8	16	16
1600 x 1200	60.000 Hz	75.000 kHz	162.000	8	16	16
1600 x 1200	65.000 Hz	81.250 kHz	175.500	8	16	16
1600 x 1200	70.000 Hz	87.500 kHz	189.000	8	16	16
1600 x 1200	75.000 Hz	93.750 kHz	202.500	8	16	16
The following five configurations are available only on Power Macintosh G3 computers with the revision 2 logic board:						
1280 x 960	75.000Hz	75.000kHz	126.000MHz	8	16	32
1280 x 1024	75.025Hz	79.976kHz	135.000MHz	8	16	32
1280 x 1024	85.024Hz	91.146kHz	157.500MHz	8	16	32
1920 x 1080	59.994Hz	70.313kHz	180.000MHz	8	16	16
1920 x 1080	71.992Hz	84.375kHz	216.000MHz	8	16	16

Table Notes:

* This mode is derived from VESA 640 x 400 timings (used primarily as a games mode).

Image bit depths:

32 bits=millions of colors

16 bits=thousands of colors

8 bits=256 colors

Internal Disk Drives

The following drives come factory-installed in your computer:

- Apple SuperDrive 1.4 MB high-density floppy disk drive
- Apple ATA hard disk drive
- 24x-speed ATAPI CD-ROM drive
- Internal 100Mb Zip drive for fast, easy storage or backup (some configurations)

Interfaces

- One ADB port supporting up to three ADB input devices (such as a keyboard, mouse, or trackball) daisy-chained through a low-speed, synchronous serial bus
- Monitor port supporting color and grayscale monitors of various sizes and resolutions Two internal ATA connectors: one supports the hard disk drive and one supports the built-in CD-ROM drive
- Three internal expansion card slots supporting PCI expansion cards. Install only expansion cards that come with Macintosh drivers and are compliant with the PCI 2.1 standard. NuBus cards cannot be used in these expansion slots.
- One printer port and one modem port. Both ports are RS-232/RS-422 serial ports, 230.4 kilobit (Kbit) per second maximum (up to 2.048 megabit [Mbit] per second if clocked externally), and are compatible with GeoPort devices such as the GeoPort Telecom Adapter. (**Note:** *The original information printed in the guide is incorrect. The ports are compatible with LocalTalk and GeoPort cables. The GeoPort Telecom Adapter with Apple Telecom software is not supported.*)
- One built-in 10Base-T Ethernet RJ-45 connector for direct connection to 10Base-T networks
- One 3.5-mm sound output port for headphones or amplified speakers
- One 3.5-mm sound input port for stereo sound input. The sound input port supports the Apple PlainTalk Microphone that comes with some Macintosh computers. The sound input port also supports a standard stereo (miniplug-to-RCA) cable adapter for connecting stereo equipment to your computer. The sound input port does not support the omnidirectional microphone (the round microphone shipped with some earlier models of Macintosh) or the attenuated RCA adapter provided with some Macintosh models.

Optional Audio/Video Interfaces

Some Power Macintosh G3 models include the following audio/video interfaces:

- Two pairs of RCA-type audio ports for stereo input and output
- Two composite video ports for video input and output
- Two S-video ports for video input and output

All the video ports support the NTSC and PAL video standards. The video input ports also support the SECAM video standard.

SCSI Interface

Your computer has one standard SCSI chain, which is capable of transferring data at up to 5 MB per second. The SCSI chain can support up to seven internal and external SCSI devices. This section describes the internal SCSI expansion options. For information on connecting external SCSI devices, see Setting Up Your Power Macintosh G3 Series Computer manual. An Apple-authorized dealer or service provider can install internal SCSI devices.

The computer has two internal expansion bays. Each one accepts a 3-1/2" or 5-1/4" storage device that is up to 1.625" (41.3 mm) high. Some models come with a Zip drive already installed in one of these bays. An Apple-authorized dealer or service provider can install internal SCSI devices, along with any necessary data cabling or brackets to properly secure each SCSI device inside the computer. (Models with an internal Zip drive have an internal SCSI cable that includes an extra SCSI connector for the second expansion bay. Models without an internal Zip drive do not come with an internal SCSI cable; a dealer or service provider must install a SCSI cable in order to connect internal devices to the SCSI chain.) An Apple-authorized dealer or service provider could also replace the CD-ROM drive with a 5.25-inch (or smaller) device as tall as 1.625 inches (41.3 mm), or replace the floppy disk drive with a 3.5-inch device as tall as 1.04 inches (26.0 mm).

All internal and external devices on the SCSI chain must have unique ID numbers. SCSI ID numbers 0 through 6 are available. If the computer came with an internal Zip drive, the drive already has SCSI ID number 5 assigned to it. The computer itself has been assigned SCSI ID number 7.

Important: Some older SCSI devices may require updated drivers to work with your computer. (A "driver" is special software that is installed in your System Folder.) Contact the device manufacturer for information on obtaining driver software.

Clock/Calendar

CMOS custom circuitry with long-life battery

Keyboard

Supports all Apple Desktop Bus (ADB) keyboards

Mouse

Supports all models of the ADB mouse

Audio System

Custom sound circuitry, including a stereo generator (digital-to-analog converter, or DAC) capable of driving stereo miniplug headphones or audio equipment and stereo sampling hardware (analog-to-digital converter, or ADC) for recording stereo sound.

- 16-bit stereo input and output
- Sample rates of 44.1 and 22.05 kilohertz (kHz)

Warning: Do not attempt to replace the clock battery yourself. If the clock begins to lose accuracy, have an Apple-authorized service provider replace the battery. The service provider will dispose of the battery according to the local environmental guidelines.

Typical Audio Specifications

Sound input using the sound input port:

- Input impedance (preamp off): more than 80 kilohm ($k\Omega$)
- Maximum input voltage (preamp off): 1 Volt (V rms) = 2.8 Volts peak-to-peak (V pp), nominal
- Input impedance (preamp on): more than 5 $k\Omega$
- Maximum input voltage (preamp on): 62 millivolts (mV rms) = 175 mV pp , nominal

Sound output using the sound output port:

- Output impedance: 33 Ω , nominal
- Maximum output voltage: 0.94 V rms = 2.65 V pp

Noise, Distortion, and Bandwidth:

- Sound input signal-to-noise ratio (SNR): 85 decibels (dB) unweighted (add +8 dB to estimate A weighting)
- Total harmonic distortion: 0.05%
- Bandwidth: 20 Hz 20 kHz at 44.1-kHz sample rate (Other sample rates scale the upper cut off frequency.)

AC line input:

- Line voltage: 100 120 volts alternating current(V AC) and 200 240 V AC, rms, single phase, manually set by voltage selector switch
- Frequency: 50/60 Hz
- Power: 250 watts (W) maximum continuous; 360 W peak input

AC line output:

- Output receptacle: 100 120 V AC; 3 amperes (A) maximum, or 200 240 V AC; 1.5 amperes (A) maximum (determined by actual input voltage)

DC power:

Continuous output: 161 W

Peak output (for 12 seconds at startup): 210 W

Output Voltage	Maximum Current
+5V	18.3A
+5V (trickle)	0.1A
+3.3V	12.5A
+12V	6.2A
-12V	0.4A

-- Total continuous power output cannot exceed 161 W.

-- Not more than 104 W total combined power.

Apple Desktop Bus (ADB)

- The mouse draws up to 10 milliamperes (mA).
- The keyboard draws 2580 mA (varies with keyboard model used).
- The maximum current available for all ADB devices is 500 mA.
- The ADB port can support up to three ADB devices.

Audio and Telecommunications Devices

The following table shows power allowances for external devices connected to input ports.

Device	Voltage	Current	Power
Microphone	+5V	20mA	100mW
A device connected to the printer port or modem port	+5V	500mA	2.5W

Expansion Cards and Other Internal Devices

If you add an expansion card or a 3.5-inch storage device to your computer, make sure the component's power requirements don't exceed the maximum power allowances allocated to it by the computer.

The maximum power allowances for expansion cards in your computer can accommodate three 15-watt, two 25-watt cards, or one 15-watt card and one 25-watt card. Some detailed guidelines are presented in the following table.

Device	Voltage	Current	Power
Expansion card (15 watts)*	+5V	3A	15W
	+12V	0.500A	6W
	-12V	0.100A	1.2W
	+3.3V	2A	6.6W
Expansion card (25 watts)**	+5V	5A	25W
	+12V	0.500A	6W
	-12V	0.100A	1.2W
	+3.3V	2A	6.6W
Storage devices (such as a hard disk)	+5V	3A	15W
	+12V	2.3A	27.6W
	+12V	6.2A peak***	-
Notes: * 15-watt expansion cards should not consume more than 15 watts of total power. ** 25-watt expansion cards should not consume more than 25 watts of total power. *** Peak power is for startup only and must not occur in normal operation.			

CD-ROM drive

Disc speed:

- 24x (twenty-four times speed)

Disc diameters supported:

- 120 mm (4.7 inches)
- 80 mm (3.2 inches)

Data capacity:

- 656 MB, Mode 1
- 748 MB, Mode 2

Modes supported:

- Audio CD
- CD-ROM: Modes 1 and 2
- CD-ROM XA: Mode 2, Forms 1 and 2

TITLE

Apple Software Restore: How to Use

Article ID: 24270
Created: 12/15/97
Modified: 1/11/00

TOPIC

This article is intended to give you a brief overview of Apple Software Restore included with some Macintosh computers. Please note that this article covers Apple Software Restore, not Apple Restore that came bundled with some Macintosh Performa computers.

DISCUSSION

If any of the applications or extra files on the hard disk are damaged or erased inadvertently, Apple Software Restore will allow you to restore the complete set of software originally installed on your hard disk.

Follow these steps to restore software to your hard disk:

- 1) Insert the System Software CD that came with your computer into the computer.
- 2) Select Restart from the Special menu to restart the computer. Press the C key until the "Welcome to Macintosh" message appears. (This key allows the computer to start up from the CD.)
- 3) Locate and open the Restore Installed Software folder on the CD.
- 4) Double-click the Apple Restore icon.
- 5) Read the program's greeting and click OK.

Note: Versions of Apple Software Restore prior to 1.3.1 will not have the Volume Format option.

- 6) Select the configuration you wish to restore and click the Restore button.

TITLE

Power Macintosh G3 (Desktop): 128MB Memory DIMM Support

Article ID: 24343
Created: 2/5/98
Modified: 4/9/98

TOPIC

The Power Macintosh Desktop G3 says that it only supports 192MB of memory. Can this be increased? Can I install 128MB modules?

DISCUSSION

The Power Macintosh Desktop G3 supports SDRAM DIMMs as defined by the mechanical JEDEC MO-161 specification, and the electrical specification as defined by the JEDEC Standard.

Electrically, the Power Macintosh Desktop can support 384MB of memory. Physically, however, the standard 128MB DIMM required for 384MB of memory is too tall for the Desktop case. Therefore, Apple only specifies 192MB of memory in the desktop unit.

Some Third Party vendors have redesigned their 128MB DIMMs to be slightly shorter and to fit in the desktop case. If the developer has followed the electrical JEDEC specification and verified the design and functionality for the Power Macintosh G3 Desktop, then these shorter DIMMs should work without problem in the Power Macintosh Desktop G3.

In addition, it is the responsibility of the third party manufacturer, not Apple Computer, Inc., to verify the design and ensure the reliability of their memory modules, including standardized parts, designed for the Macintosh.

TITLE

PowerBook G3, PowerBook G3 Series: No Contrast Control

Article ID: 24459
Created: 4/21/98
Modified: 1/4/00

TOPIC

How do I adjust the display's contrast on a PowerBook G3 or PowerBook G3 Series computer? I can't find the Contrast control button.

DISCUSSION

The PowerBook G3 and G3 Series computers have a fixed-contrast, liquid-crystal display like the PowerBook 2400. You cannot change the contrast on these displays.

You can, however, make some adjustments to the display by using ColorSync. Install the latest version of ColorSync (available at the Apple Software Updates Web site). Next, open the Monitors & Sound control panel and click the Color button. On the bottom of the window you will see a list of ColorSync Profiles and a Calibrate button. Click the button to launch the Apple Monitor Calibration Assistant. Walk through this series of adjustments until you get the screen the way you want it. Disregard the contrast setting instruction, but experiment with the other settings. The Target Gamma page will probably provide you with a contrast setting that will satisfy you. Then save the setting and you will return to the list of profiles. Select the new one and you are done. You can make multiple calibrations and create a choice of various settings for use in different applications or environmental settings.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read Tech Info Library article 24604: "[PowerBook G3, G3 Series: Identifying Different Versions](#)"

TITLE

56Kbps Modems: Getting The Fastest Connection

Article ID: 24482
Created: 5/28/98
Modified: 11/4/99

TOPIC

My 56K modem is not connecting at the speed I expected. I understand that regulations in North America and some other countries limit connections to 53 kilobits per second, but my modem seldom connects at greater than 36 Kbps. Is it malfunctioning? Can anything be done?

DISCUSSION

A modem is unlikely to malfunction only to the extent that it is unable to achieve its top speeds. Lesser speeds are common and generally reflect limitations imposed by the operating conditions:

- Impairments in the telephone network path
- Interoperability issues between modems
- Modem settings

This article provides an overview of these conditions as they affect the connection speed and reliability of 56K modems, though much is equally relevant to other modems. It joins a large body of complementary material available online from many modem manufacturers and modem-related web pages.

But first, just how fast is that connection?

MEASURING CONNECTION SPEED

Initial connection speed. The PPP or Remote Access control panel shows the speed initially established, not the current or average connection speed, which often differs.

If operating conditions permit a faster connection, the modem will attempt to speed up (fall forward). If conditions prevent sustaining a speed without incurring excessive transmission errors, the modem will slow down (fall back). Because these adjustments are common but not reflected in the software, do not base performance measurements solely upon initial connection speed.

DTE speed (modem-to-computer speed or port speed) is generally represented by the static numbers 38400, 57600, or 115200, as configured in the software. It is not a measurement of connection speed. The ARA modem scripts (selected in the Modem control panel) for all Apple 56K modems correctly configure the DTE speed for a maximum of 115200 bps.

Determining the average Data Transfer Rate. Data Transfer Rate (DTR), or throughput, describes how fast data is being transferred, expressed in bits per second. The following method of obtaining the average DTR is a truer method of assessing modem performance than observing the initial connection speed or the fluctuating throughput indicators of web browsers or FTP clients. Because the upload (transmit) speeds of analog modems cannot exceed 33.6K, the discussion is confined to download (receive) speeds.

1. Connect to the internet and, preferably, open an FTP client application rather than a web browser. Anarchie, Fetch, NetFinder, and Viconsoft FTP Client are popular shareware examples.
2. Log in to an FTP server. Many Internet Service Providers make local FTP servers available for their members, and most FTP clients include a selection of public FTP server bookmarks. If you know of any FTP servers that are not very busy or are geographically nearby, use them. The more frequently the modem has to wait for a busy server to respond, the less accurate the test results will be. The greater the server's distance, the more likely the connection will pass through additional line impairments that may slow the connection.

3. Download a compressed file of approximately 500K or larger. Most compressed files have a file name extension of .sit, .sea, .cpt, or .zip. Apply the formula **file size (bytes)/download time (seconds) x 9 = average DTR (bits/second)**:

Example

For a 500K file that takes 2 minutes 5 seconds to complete downloading, the equation reads:

$$500,000 / 125 \times 9 = 36,000$$

The average DTR was 36K (kilobits, not kilobytes) per second, though the actual DTR at any moment may have been higher or lower.

About File Size

The file sizes shown in FTP client windows are generally approximate. Convert kilobytes to bytes using the decimal format appropriate to measuring data transfer rates, where 1K = 1,000 bytes. To convert the average DTR from bits per second to kilobits per second, always divide the result by 1,000.

About Download Time

The FTP client's download progress indicator may appear shortly before the file begins downloading. Do not begin timing until the download appears to be underway. Use your own timer instead of relying upon any download time that may be reported by the FTP client.

Why the Formula Is Not Perfect

Average DTR will be greater than calculated when transmission errors require data to be re-sent, thus increasing download time without changing file size. And if the modem negotiates a connection requiring start and stop bits (2 bits added to the baseline 8 bits per byte), DTR will be greater by an additional 1 bit per byte transferred. Because all connections require transmission of some amount of extra data, using 9 as the third variable in the formula provides a serviceable if not always entirely accurate compromise.

4. Disconnect, then repeat the procedure using different FTP servers at different times of the day, especially during the off-hours of early morning or late evening. The averaged results best represent what the modem is able to achieve under its current operating conditions, so look for improvement by making the operating conditions more suitable for faster connections.

OPERATING CONDITIONS AFFECTING CONNECTION SPEED & RELIABILITY

Impairments in the telephone network path

1. Multiple analog/digital conversions. Connections are limited to a maximum of 33.6 Kbps where more than one analog section exists in the telephone network path between modems. The first analog section begins with your modem. Internet Service Providers fully supporting 56K modem connections must provide a completely digital connection, but additional analog sections may be introduced elsewhere in the path.

What you can do

Nothing. The telephone company can confirm the presence of multiple A/D conversions in a path, but consider that no two calls are necessarily routed through the same path, even when dialing the same number. This is one reason why throughput can vary with each connection. There is always the hope that the telephone network in your area will be upgraded.

2. Signal interference & distortion. The telephone network path between modems must be sufficiently free of noise and frequency distortion to permit the desired speed. The modem analyzes these line impairments as they affect the quality of the transmission signal. Poor signal quality causes transmission errors, reduced throughput, reduced connection speed, and even dropped connections.

What you can do

a. Experiment with eliminating potential sources of line impairments in the home:

- Any device connected to any telephone outlet, especially if used by the modem, and even if on a different line: telephones, including cordless telephones and their base stations, answering machines, fax machines, caller ID boxes, and other modems
- Telephone line splitters, cable extenders, faulty or overly long telephone cables (shorter is better)
- Surge protectors, including those that offer telephone line protection
- Alarm systems, especially those that are connected to the telephone system
- Computer equipment, including speakers
- Fluorescent light fixtures and light dimmers
- Satellite dish receivers
- Appliances such as air conditioners, refrigerators, dryers, microwave ovens, and televisions
- Any AC power source and related cabling
- All other things electrical, including issues with the premises wiring: loose or corroded connections, too many splices or bridges, insulation deterioration and exposed wiring, non-twisted pair telephone wiring

Start with a direct, unobstructed, modem-to-outlet connection using a short, high-quality telephone cable. As a way of confirming the issue

prior to isolating it any further, there is the option of testing with a direct connection to the external telephone box located at the back or side walls of the residence. It provides one or more standard telephone jacks supplying the home telephone connections but bypassing most impairments inside.

b. Listen for noise. Because the telephone company is only obligated to provide voice-quality phone lines, it is unlikely to address the many and varied off-premises sources of line impairments that can affect connection speed but don't cause audible noise. Connect a telephone to the wall jack used by the modem, then pick up the line, dial the number 1 to stop the dial tone, and listen. Contact the telephone company if the line is not quiet (loud hiss, pops, static, voices), but first disconnect other telephone devices and check again.

c. Use a local dial-in number to your Internet Service Provider. Long distance and 800 numbers aren't typically a concern, but may cause the call to be routed through more facilities, indirect paths, and different carriers with different types of equipment and lines. Local calls may be auto-forwarded in the same manner, but most reputable ISP's don't engage in this practice. Finally, note that if you are dialing 9 to get an outside line, you are probably using a phone system that will limit throughput to around 33.6K or less.

Interoperability issues between modems

1. The modems on both the client and server side must support the same protocol. Apple 56K modems support K56flex and V.90, but not X2. Apple/GV 56K modems that have been flash-ROM updated support either K56flex or V.90, depending upon the modem updater used.

What you can do

Confirm with your ISP that you are dialing in to a number answered by a modem of the same 56K protocol as yours.

2. Where modems of different makes, models, firmware/flash-ROM revisions, and chipsets are concerned, one modem may have an incompatible method of implementing a connection that it has negotiated with the other modem, or the negotiation itself may fail. For example, if a modem cannot sustain the current connection speed but is unable to successfully negotiate a slower connection with the other modem, the connection will incur excessive transmission errors, decreasing throughput and potentially forcing a disconnect.

What you can do

a. If your modem can be flash-ROM upgraded via software, apply the most recent modem update available. Apple 56K modem updates are available online. The latest firmware code may make the two modems more compatible--or less.

b. Force a slower connection from the very start, such as by disabling 56K protocols in favor of V.34. This change is incorporated into the "V.34 Only" modem scripts available for some Apple 56K modems. A variety of other modem manufacturers supply similar ARA modem scripts for their modems. If you are connecting to the internet using software that does not use modem scripts, supply the software with a custom initialization string for your modem. Your ISP may be able to assist you, or you can teach yourself the proper initialization string by studying the AT command guide provided with your modem or available online from the manufacturer.

c. Ask your existing Internet Service Provider whether different modems are available via an alternate dial-in number, or switch to an ISP that provides different modems (call them first, as they may already know of issues they are having supporting the modem you are using). If all else fails, you may wish to go so far as to try a different modem yourself--one that your ISP recommends for best compatibility.

The settings of either modem

The default configuration of either modem may be altered to enforce one type of modulation over another (Apple's V.34 modem scripts enforce V.34, for example); disable or change the type of compression, error correction, and flow control; change the maximum and minimum speeds allowed, and respond differently when, for example, error correction fails. These settings are changed from their defaults--the factory settings--by the modem initialization string. Depending upon the connectivity software used, the modem initialization string is either entered manually into the software or is part of an Apple Remote Access modem script.

What you can do

a. Be certain that you are using the correct modem script for your modem. Macintosh computers that ship with internal modems already include the necessary modem script, and many manufacturers also provide them online separately or with modem firmware updates.

b. Try an alternate modem script if the software or the modem manufacturer provides one. A different modem script may contain an initialization string more suitable to your operating conditions. Externally contributed modem scripts may also be found in the Communications directory of Info-Mac FTP servers and elsewhere on the Internet.

c. Edit the initialization string contained in your modem script or use software that provides the option of entering an initialization string directly, such as FreePPP or MacPPP. Your Internet Service Provider may be able to tell you what initialization string, if any, they recommend for best compatibility with their modems. They may require that you fax them the AT and S-register command set from the modem's documentation, as these can vary among modems. Don't expect too much: the modem's default settings and those defined in the modem script typically place the modem into its most robust and flexible configuration, so changes often amount to turning off features that

are beneficial in most circumstances. That is why Apple does not provide end-user instruction in modifying ARA modem scripts, other than to make an unsupported tool, the Modem Script Generator, available online.

A failed modem

Again, a modem is unlikely to malfunction only to the extent that it is unable to achieve its top speeds, but it's a possibility that cannot be discounted outright. To find out, use your modem in place of another **identical** modem that is able to attain higher speeds. Conversely, use an **identical** modem that is able to attain higher speeds in place of your own modem.

If you don't see similar results using the formula provided above, and both modems are using the same modem cable and power supply (if present), and both have been updated to the same firmware revision, there may be a hardware issue with the slower modem.

FREQUENTLY ASKED QUESTIONS:

Q. I found a new ARA modem script on the Internet that claims to make my modem faster, and sure enough, I'm now connecting at 48000 bps every time.

A. Be wary of modem scripts that always report the same initial connection speed or that claim to exploit supposedly hidden features in the modem. When evaluating a new modem script or modem initialization string, base your judgement upon the modem's stability and apply the formula for obtaining the average DTR. A modem script can force a high initial connection speed (or lie about it), but cannot force the modem to sustain that speed without dropping the connection. It is of little benefit to have a fast but unreliable connection, or one that always starts fast before slowing down dramatically.

Q. My Internet Service Provider advised me to disable error correction and compression in order to boost my connection speed. Is this advisable?

A. Rarely. That advice is grounded in the notion that, over heavily impaired lines, the overall throughput of the modem may decrease when the error-correction protocol is forced to retransmit data to correct the errors. But without error correction and compression, the integrity of the data being transferred cannot be maintained. The Remote Access control panel provides an "allow error correction and compression in modem" checkbox that may be disabled if you wish to experiment.

Q. Would it help to connect with something else besides Remote Access or Open Transport/PPP?

A. Probably not, but feel free to experiment. Examples of other connectivity software are FreePPP, MacPPP, LinkUPPP!, and SonicPPP. The first two do provide a more convenient method of changing the modem initialization string than software that uses Apple Remote Access modem scripts.

Q: I'm making a connection between my home and office 56K modems using Apple Remote Access Personal Server, but I cannot exceed 33.6 Kbps, despite achieving faster rates when connecting to my ISP. Is this normal?

A. Yes. In order to provide the fully digital server-side connection required to exceed 33.6 Kbps (see part 1 of "Impairments in the telephone network path"), an Internet Service Provider uses high speed digital servers and modem racks quite unlike the consumer modem setup. The home-to-office scenario described not only introduces an additional analog segment to the network path, but cannot avoid the 33.6K upload (transmit) limit now affecting both sides of the connection instead of just the client side. Note that the connectivity software (ARA, Timbuktu, a terminal application) is not relevant to these limitations.

Q. Is it possible to determine the highest connection speed attained during a connection, instead of just the average DTR?

A. After terminating the connection, issue an AT&F and AT&V1 command from a terminal program. This works for most modems. The results will look something like this:

```
AT&F
OK
```

```
AT&V1
TERMINATION REASON..... LOCAL REQUEST
LAST TX rate..... 21600 BPS
HIGHEST TX rate..... 21600 BPS
LAST RX rate..... 24000 BPS
HIGHEST RX rate..... 24000 BPS
PROTOCOL..... LAPM
COMPRESSION..... V42Bis
Line QUALITY..... 035
Rx LEVEL..... 023
Highest Rx State..... 67
Highest TX State..... 67
```

```
EQM Sum..... 00C3
Min Distance..... N/A
RBS Pattern..... FF
Rate Drop..... FF
Digital Loss..... None
Local Rtrn Count..... 00
Remote Rtrn Count..... 00
Flex fail
```

HIGHEST RX rate (or MAX RX and similar) represents the highest connection speed attained. Note also the line QUALITY entry: values greater than approximately 020 suggest a line quality that is unlikely to permit connections greater than 33.6K, but results may vary.

TITLE

Apple Studio Display 15" LCD: "No Computer Signal"
Message

Article ID: 24494
Created: 6/27/98
Modified: 1/12/00

TOPIC

I have an Apple Studio Display (15" LCD) and when my computer goes into sleep mode the display does not go into sleep mode. Instead a message saying "No Computer Signal" is displayed. Is this correct behavior?

DISCUSSION

The Apple Studio Display should go into sleep mode when you select sleep or when Energy Saver is set to put the system or display to sleep. If you see the message "No Computer Signal" remain on the screen, then the Apple Studio Display needs to be reset to clear a value from its internal memory. To do this, press the reset button on the front of the Apple Studio Display (far left button with the triangle icon) until the LED starts to flash.

TITLE

PowerBook G3 & G3 Series: Identifying Different Models

Article ID: 24604
Created: 9/10/98
Modified: 12/21/99

TOPIC

Apple has introduced a number of PowerBook computers with PowerBook G3 in the name. This article provides a method for differentiating between the various models. Though the names are similar, there are significant differences.

DISCUSSION

There are two definitive ways to differentiate the various PowerBook G3 models: by family number or by visual inspection. Remember that family numbers are not the same as model numbers, which are usually listed on the invoice or proof of purchase.

Identifying by Family Number

The product label on the bottom case of all PowerBook products lists the family number. Use the table below as a cross reference.

Model	Family Number
PowerBook G3 introduced October 1997	M3553
PowerBook G3 Series introduced May 1998	M4753
PowerBook G3 Series introduced September 1998	M4753
PowerBook G3 Series (Bronze keyboard) introduced May, 1999	M5343

Identifying By Visual Inspection

PowerBook G3

The Macintosh PowerBook G3 (M3553) has a small, six-color Apple logo on the exterior display housing, two small vents on the display housing, and it closely resembles the older PowerBook 3400.

PowerBook G3 Series

The Macintosh PowerBook G3 Series (M4753) has a large white Apple logo embedded near the middle of the display housing. The G3 Series has two PC Card slots and a Modem port on its left side. On the rear of the computer, the microphone and speaker ports are exposed.

The design of the PowerBook G3 Series is new for the product.

- It is slimmer--that is, it is not as thick as the older PowerBook G3 computer.
- It is about an inch longer and an inch wider than the older PowerBook G3 computer.

PowerBook G3 Series (Bronze keyboard)

The PowerBook G3 Series (Bronze keyboard) (M5343) also has the embedded white Apple logo. The main visual difference is the keyboard, which has a bronze translucent color. The computer has a single PC Card slot on the left side, no exposed Modem port, and is slimmer than the previous PowerBook G3 Series. Also, the ports on the back side of the computer are fully covered by the I/O door.

Additional information on the PowerBook G3 Series (Bronze keyboard) can be found in Tech Info Library Article 58328: "**PowerBook G3 Series (Bronze keyboard): How to Differentiate From Other PowerBook G3 Series Computers**".

TITLE

Mac OS 8.5: Mac OS Help Crashes With Type 3 Error

Article ID: 24676
Created: 10/19/98
Modified: 12/1/98

TOPIC

This article describes a circumstance under which Mac OS Help will quit with the alert, "The application "" has unexpectedly quit because an error of Type 3 occurred."

DISCUSSION

When an incompatible version of Internet Config Extension is installed, or if the extension is missing, Mac OS Help will return an alert

Because Internet Config Extension is installed by a variety of Internet programs (web and FTP browsers, for example), it is possible for the version of Internet Config Extension included with Mac OS 8.5 to be silently replaced by an older version of Internet Config Extension during program installation.

To correct, ensure that Internet Config Extension version 2.0.2 or later is installed in the Extensions folder of the System Folder. If necessary, use the Mac OS 8.5 Installer to perform a custom-install of the Internet control panel. Both the Internet control panel and Internet Config Extension will be installed. Proceed as follows:

1. After you get to the "Custom installation and removal" screen that gives you all the various check boxes to select components, check the "Mac OS 8.5" box.
2. Click in the "recommended installation" field to the right and select "customized installation".
3. Scroll down to the bottom click the arrow to the left of the Control Panels option.
4. Check the box next to "internet".
5. Select OK.

This will also address the requirement for Internet Config expressed in the alert shown in Figure 2. For more information about how Internet Config relates to Mac OS 8.5, please see the following Tech Info Library article:

TITLE

Mac OS 8.5: Internet Control Panel Or Internet Config?

Article ID: 24679
Created: 10/20/98
Modified: 12/9/98

TOPIC

This article discusses important differences between the Internet control panel and the Internet Config application.

DISCUSSION

Mac OS 8.5 introduces the Internet control panel, providing features previously obtained through the Internet Config application. For more detail on these features, please see the following Tech Info Library article:

Article 58100: "**Mac OS 8.5: Internet Control Panel Features**"

Internet Config is not an Apple product, but was bundled with some prior versions of the Mac OS as part of a suite of useful third party Internet utilities. Mac OS 8.5 now integrates the functionality of this application into the new Internet control panel, which offers an entirely different look and feel.

Despite the differences in appearance, both applications are so closely related that they write to the same preferences file and use the same extension. Mac OS 8.5 is thus able to accommodate any Internet application that is configured to use Internet Config. Those who obtain Internet Config are nevertheless free to use it with Mac OS 8.5 instead of the Internet control panel, but with the following cautions:

-- Neither application's settings take precedence over the other because they both write to the same preferences file. Identical settings can thus be altered equally with either application. When using the Internet control panel in Administration mode (choose "User Mode" from the Edit menu to select Administration mode) to password-protect the settings, Internet Config will honor that protection.

-- Internet Config is able to install Internet Config Extension, but since Mac OS 8.5 already includes Internet Config Extension version 2.0.2, using Internet Config to install it again may cause it to be replaced by an older version, potentially interfering with Mac OS components (such as Mac OS Help) that rely upon having the correct version present. If in doubt, use the Internet control panel instead of Internet Config, despite Mac OS 8.5's own references to Internet Config in certain alert messages.

To install Internet Config Extension separately, use the Mac OS 8.5 Installer to perform a custom-install of the Internet control panel. Both the control panel and the extension will be installed. Proceed as follows:

1. After you get to the "Custom installation and removal" screen that gives you all the various check boxes to select components, check the "Mac OS 8.5" box.
2. Click in the "recommended installation" field to the right and select "customized installation".
3. Scroll down to the bottom click the arrow to the left of the Control Panels option.
4. Check the box next to "internet".
5. Select OK.

TITLE

PowerBook G3 Series: Identifying Circuit Boards

Article ID: 24706
Created: 11/4/98
Modified: 12/21/99

TOPIC

*** RESTRICTED: Apple Internal and Support Providers Only ***
Not For General Public Release

This article describes how to identify various circuit boards in PowerBook G3 Series computers, which is essential for ordering correct replacement parts.

DISCUSSION

When replacing PowerBook G3 series circuit boards it is very important to check the ID codes to verify that you are ordering the correct part.

The ID codes listed in the table below can be found within the serial numbers that are attached to the circuit boards. They are not part of the whole unit serial number that is attached to the bottom of the PowerBook.

These serial numbers can be located in the following locations:

Microprocessor Board: Follow the instructions in Service Source for removing the microprocessor card. With the card removed, look at the serial number/bar code label on the SODIMM connector on the bottom side of the card.

I/O Logic Board: This serial number label is viewable from the opening for the PC Card slots. You don't need to disassemble the PowerBook. Gently push in the PC Card slot doors and look inside the opening. You should see the serial number/bar code label. You may need to use a small flashlight to see the lettering on the label.

The ID codes are the next to last three characters in the serial number. For example, if the serial number is *CK8xxxxxyyx* then the ID code would be "yyy".

Identification

The serial number labels are printed in one of two ways:

The ID codes are the next to last three characters in the serial number. For example, if the serial number is *CK8xxxxxyyx* then the ID code would be "yyy".

-OR-

A different type of serial number label has "Singapore" printed directly after the serial number. In this case, the serial number labels have the ID codes within the last 5 characters of the serial number. For example, if the serial number is *KC8xxxxxyyx* then the ID code would be yyy.

Exchange Parts Like for Like

Unless directed otherwise in the Service Parts Database, exchange parts like for like. Refer to the following table for the listing of ID Codes.

Part	Description	Service Part Number	ID Code
------	-------------	------------------------	---------

Microprocessor Board	233 MHz/0 cache	661-2035	BKF
	233 MHz/512K cache	661-2089	DW3, ERN
	250 MHz/1 M cache	661-2036	BKE
	266 MHz/1 M cache	661-2097	EE8
	292 MHz/1 M cache	661-2021	BAD
	300 MHz/1 M cache	661-2088	DW4
I/O Logic Board	2 MB SGRAM, no TV out	661-2058	BKG, DGK, DFL
	2 MB SGRAM, TV out	661-2094	DW6
	4 MB SGRAM, TV out	661-2087	DW7
	4 MB SGRAM, TV out	661-2019	B9B, DGL, DFM

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read Tech Info Library article 24604: "[PowerBook G3, G3 Series: Identifying Different Versions](#)"

TITLE

Sherlock: Internet Config Conflict

Article ID: 24736
Created: 11/30/98
Modified: 8/25/99

TOPIC

I am having trouble using Sherlock. When I try to perform an Internet search, I get an error dialog stating " A network error occurred. Check your network connections and settings, then try again." Can you help?

DISCUSSION

This error message may appear for a number of reasons. One possible cause is having an older version of Internet Config. It should be noted that this problem is not specifically an Internet Config 1.3 problem.

There is an Internet Config preference (kICUseHTTPProxy) that is defined to be a boolean (1 byte). It has not been determined exactly which application does this, but at least one application will set this preference to be a word (2 bytes). When Sherlock asks Internet Config for this preference, an error is returned because we are asking for a byte, but the property is stored as two bytes.

The workaround is to:

1. Open the "Internet" control panel.
2. Under the "Edit" menu, select the "User Mode..." menu.
3. Select the "Advanced" radio button and click OK in the dialog that comes up.
4. Select the "Advanced" tab in the "Internet" control panel.
5. Select the "Firewalls" icon in the list of the "Advanced" tab.
6. Select the "Web Proxy" check box.
7. Choose "Save Settings" from the "File" menu.
8. Uncheck the "Web Proxy" check box.
9. Choose "Save Settings" from the "File" menu.

This resets the kICUseHTTPProxy Internet Config preference to be stored as a byte instead of 2 bytes.

TITLE

iMac Update 1.1: Misidentified With Apple System Profiler
2.1.2

Article ID: 24777
Created: 1/12/99
Modified: 1/13/00

TOPIC

I have encountered a few problems since installing the iMac Firmware Update and the iMac Update 1.1. Thinking that the problems may be associated with one of the updates, I used the Apple System Profiler to check the version numbers and it appears that Mac OS ROM version is not as recent as the one that was previously installed. Should I put the older Mac OS ROM file back?

DISCUSSION

First, Apple does not recommend going back to the previous Mac OS ROM file.

Your confusion results from the incorrect information being displayed in the Product Information section of Apple System Profiler 2.1.2.

Mac OS ROM file version as seen in Apple System Profiler 2.1.2 under Production Information:

iMac Update 1.0	1.1.5
iMac Update 1.1	1.1b2

This is not correct.

Use the information found in About This Computer or the Get Info box for the Mac OS ROM file to see what it should say.

After installing the iMac Update 1.1, About This Computer states that the Mac OS ROM file is version 1.2.1.

You can also use the USB section of "Devices and Drivers" of Apple System Profiler. If you have the iMac Update 1.1 installed the USB version will show up as 1.1. If you see 1.0.1 or 1.0, then you have an older Mac OS ROM file on your iMac and should install the update.

Hard Drive Matrix

Article ID: 24782
Created: 1/14/99
Modified: 12/21/99

TOPIC

*** RESTRICTED: Apple Internal and Support Providers Only ***
Not for General Public Release

This article contains the Apple Hard Drive Matrix, listing (and identifying) all the various hard drive mechanisms used.

This matrix is also available as an Adobe Acrobat Reader document (.pdf file), and can be found in two places:

- The Service Source CD contains the Hard Drive Matrix. From within the Service Source interface, click the Hardware tab along the upper edge of the window. Then click the Hard Drives tab along the left side of the window. You will then be presented with a link to the Hard Drive Matrix.
- Service Source Online contains the Hard Drive Matrix. It is available for download, or can be viewed online in your browser. The file can be found in the Service Tools section of Service Source Online.

The Service Source Online URL is:

<http://service.info.apple.com/>

Note: Service Source Online is a secure site. You must have the current user name and password in order to gain access to the site. The current user name and password are included with the latest version of the Service Source CD.

TITLE

Troubleshooting "No Dial Tone"

Article ID: 24789
Created: 1/21/99
Modified: 11/4/99

TOPIC

When the modem cannot detect or successfully acquire a dial tone, the connection attempt will fail, and Apple Remote Access will respond with a dialog box.

Use the troubleshooting path in this article to help identify the source of the problem.

Note: While this article specifically mentions iMac, it is applicable to the PowerBook G3 Series (Bronze keyboard) and Power Macintosh G3 (Blue and White) as they use a variation of the iMac modem.

DISCUSSION

If Open Transport/PPP is installed, substitute "PPP control panel" for "Remote Access control panel" throughout these instructions.

Step One

Don't Confuse A No Dial Tone Error With A Silenced Modem

The audio feedback of some Apple internal modems, such as for the iMac and Power Macintosh G3 (Blue and White), is passed through the computer speakers and can therefore be silenced by the computer volume control, but not such that a no dial tone error will result.

Turn the computer volume up in the Control Strip or the Monitors & Sound control panel. Increasing the volume will automatically deselect the Mute button in Monitors & Sound.

Step Two

Verify Physical Connectivity

- a.** Check the telephone line connection at the wall outlet and the modem. For computers with internal modems, ensure the line is not connected to the ethernet port (if available) by mistake. Push firmly in on the connectors at both ends, or disconnect and reconnect them, to seat them securely.
- b.** External modems provide an additional jack for connection to a telephone. Do not connect the line from the wall outlet to this jack, which will often be identified by an icon of a telephone base unit with handset.

Note: Most analog modems are incompatible with digital/PBX phone lines. If an ordinary residential consumer telephone has worked in the same outlet, it is a compatible analog line.

Step Three

Configure The Modem Control Panel

Configure the Modem control panel to use the modem script appropriate for the modem. Apple-branded internal modems use these scripts, by computer:

Computer	Modem Script
Power Macintosh G3 (Blue and White)	PowerMac G3 Internal 56K, PowerMac G3 Int56K (v.34 Only)
PowerBook G3 Series	PowerBook G3 Internal 56K, PowerBook G3 Int56K (v.34 Only)

iMac	iMac Internal 56K, iMac Internal 56k (v.34 Only)
Power Macintosh G3 & Power Macintosh 6500	Apple/GV 56K
PowerBook 3400 & PowerBook G3	PowerBook 3400/G3 Internal 33.6
Geoport Telecom Adapter (internal or external)	Geoport/Express Modem

Step Four

Configure The Remote Access Control Panel And Test

- a. Open the Remote Access control panel. Enter a name (user ID), password, and telephone number.

Inaccurate entries will not prevent detection of a dial tone. However, if a prefix such as "9" must be dialed to reach an outside line, enter it before the telephone number, followed by a comma.

- b. Click Connect and listen for a dial tone, number tones, or handshaking (squealing sound). If they are audible, or if the Status field ever shows "Starting PPP," "Starting network protocols," "Communicating at 24000 bps," or any other such indicator that appears after acquiring a dial tone, the problem is fixed.

- c. If it is convenient to perform step 8 (test the line with a telephone), it may save some time to do so now. If it is not convenient, proceed through the steps in order.

Step Five

Disable Dial Tone Checking And Try Again

If the dial tone does not conform to what the modem expects to hear (because of poor signal level or quality, or non-standard frequency, for example) it may be difficult for the modem to recognize it as a dial tone. In such cases the modem software can be configured to assume that a dial tone is present without first checking for it.

- a. Open the Modem control panel and click the "Ignore dial tone" checkbox to enable it, then close the control panel and allow it to save the changes.

- b. Open the Remote Access control panel and click Connect, as in step 4. Watch and listen.

Important: Because "Ignore dial tone" is enabled, it is possible that only the number tones will be heard as dialing occurs, but not the dial tone or modem handshaking. The "modem is not responding properly" alert may then appear. If so, the problem persists.

- c. Voice mail. Disabling dial tone checking may work around the problem posed by some voice mail services that use an altered dial tone, or a series of initial tones, to notify the user of waiting voice mail. If a voice mail service is enabled on the line and the problem persists, try entering one or two commas (,) before the telephone number in the Remote Access control panel. Each comma represents a pause of a few seconds. The idea is to delay dial-out until after the voice mail tones have ended. If this works, it may not be necessary to leave Ignore dial tone enabled in the Modem control panel, though doing so will not affect modem performance.

Step Six

Trash Preferences

Damaged Remote Access preferences may be at fault. Considering that Remote Access was able to successfully detect and initialize the modem prior to checking for the dial tone, the odds of this are very unlikely, but it is easy to confirm prior to the more time-consuming tasks ahead.

- a. Move these two preference files to the desktop (or anywhere outside of the Preferences folder):

Apple Remote Access users:

- System Folder : Preferences : Modem Preferences
- System Folder : Preferences : Remote Access : Remote Access Connections

Open Transport/PPP users:

- System Folder : Preferences : Modem Preferences
- System Folder : Preferences : PPP Preferences

- b. Repeat steps 3 and 4 to reconfigure the control panels and test. If the symptom persists, the preferences were not at fault. To reclaim the configuration information they contained (optional), move them back to their original locations and allow them to replace the newer preference files that were created.

Step Seven

Hardware-Isolate The Line

Establish a point-to-point, one cable (the shorter the better) connection between the modem and the wall outlet, isolating the modem, the line, and the outlet from all other devices, including telephones, answering machines, fax machines, caller-ID boxes, cable extenders, line splitters, and so on. Then retest as per step 4.

If that works, one or more of the removed devices was hurting the line quality (thus affecting the dial tone) or pushing an already poor line past the breaking point. It may be necessary to attach those devices to different outlets or experiment with other devices, cables, splitters, and combinations thereof. Sometimes the inside or outside home wiring is at fault, requiring a telephone technician to diagnose.

Step Eight

Confirm That The Cable And Outlet Are Good

Disconnect the telephone cable from the modem (leave it attached to the wall outlet) and plug it into a telephone. Listen for a dial tone with the telephone handset. If it cannot be heard, there is a problem with the outlet or the cable. Try a different telephone cable and, if necessary, a different outlet.

It does not matter that a telephone used to work on the wall outlet at some earlier date, or that it worked there while using a different telephone cable. Unless the outlet and the cable were tested with a telephone just prior to connecting the modem to the same cable and same outlet, this must now be done.

Note: If you arrived here at step 8 directly from step 4, continue troubleshooting at step 5.

Step Nine

Perform A Clean Install Or Clean Restore

The Mac OS may be damaged.

a. Perform a clean install or clean restore of the operating system. If there is any connectivity software or modem drivers to be installed separately (Geoport modems, for example, will require the reinstallation of Apple Telecom), do so immediately afterward.

b. Repeat steps 3 and 4 to retest. If the problem continues, there may be a hardware problem with the modem.

TITLE

Troubleshooting Unreliable Modem Connections

Article ID: 24803
Created: 2/1/99
Modified: 11/4/99

TOPIC

When a successful dial-up connection is unexpectedly interrupted, Apple Remote Access responds:

"You have been disconnected."

And when similar circumstances prevent the connection from completing:

"The connection attempt failed. The activity log may have suggestions for fixing problems."

If this becomes a recurring problem, use this troubleshooting path to help identify solutions.

DISCUSSION

The occasional lost connection is to be expected given the nature of the technology and the typical operating conditions. An unreliable connection is suggested when disconnects occur more frequently, often shortly after the connection has been established.

Note: Where Open Transport/PPP is installed, substitute "PPP control panel" for "Remote Access control panel" throughout the instructions that follow.

Step One: Check the idle timeout and protocol settings

If the disconnect always occurs after a specific interval of time, or only after a period of network (Internet) inactivity, the problem may be related to either the "disconnect if idle" setting of Remote Access or the idle timeout policy of the Internet Service Provider (ISP).

a. Open the Remote Access control panel, click the Options button, then click the Connection tab. Click the "disconnect if idle" checkbox to disable it if necessary, or enter a larger number. Most ISP's will terminate the connection after similar periods of idleness. Check with your ISP for specifics.

b. Click the Protocol tab. It should be set correctly for the type of connection in use. Standard dial-up Internet connections use the PPP protocol, not the Apple Remote Access Protocol (ARAP). The hardware or software setups of some Internet Service Providers may not permit connections when the protocol is set to Automatic.

Step Two: Check for physical connection issues

If the disconnect can be encouraged by moving the modem or its associated cables, check them for secure connections and signs of damage.

Try a different, known-good telephone cable if available, then test using a direct modem-to-outlet connection. If movement still breaks the connection, seek service.

Step Three: Configure the Modem control panel

Configure the Modem control panel to use the modem script appropriate for the modem. Apple-branded internal modems use these scripts, by computer:

Computer	Modem Script
Power Macintosh G3 (Blue & White)	PowerMac G3 Internal 56K, PowerMac G3 Int56K (v.34 Only)

PowerBook G3 Series	PowerBook G3 Internal 56K, PowerBook G3 Int56K (v.34 Only)
iMac	iMac Internal 56K, iMac Internal 56k (v.34 Only)
Power Macintosh G3 & Power Macintosh 6500	Apple/GV 56K
PowerBook 3400 & PowerBook G3	PowerBook 3400/G3 Internal 33.6
Geoport Telecom Adapter (internal or external)	Geoport/Express Modem

Figure 3: Modem control panel.

Step Four: Disable call waiting

When an ongoing modem connection is interrupted by a call waiting tone signifying an incoming call, the modem will usually disconnect. Disconnects related to call waiting are random and don't usually occur only at precise intervals or always shortly after connecting.

If call waiting is enabled on the telephone line used by the modem, open the Remote Access control panel and enter *70,, before the telephone number. The extra comma, signifying an additional pause, is optional but occasionally necessary to allow the command sufficient time to be acknowledged.

If your line requires pulse dialing, use 1170,, instead. Call waiting will only be disabled for the duration of the connection.

Your local telephone company may require different numbers or may not automatically provide this feature.

Step Five: Troubleshoot interoperability issues between modems

Where modems of different makes, models, firmware/flash-ROM revisions, and chipsets are concerned, one modem may have an incompatible method of implementing a connection that it has negotiated with the other modem, or the negotiation itself may fail. For example, if a modem cannot sustain the current connection speed but is unable to successfully negotiate a slower connection with the other modem, the connection will incur excessive transmission errors, decreasing throughput and potentially forcing a disconnect.

- a. If your modem can be flash-ROM upgraded via software, apply the most recent modem update available. Apple 56K modem updates are available online. The latest firmware code may make the two modems more compatible--or less.
- b. Disable 56K protocols in favor of V.34. Limiting the modem in this way may reduce or eliminate the need for the modem to make as many adjustments in response to poor line conditions, potentially sidestepping interoperability issues altogether. This change is incorporated into the "V.34 Only" modem scripts available for some Apple 56K modems. A variety of other modem manufacturers supply similar ARA modem scripts for their modems. If you are connecting to the internet using software that does not use modem scripts, supply the software with a V.34 initialization string appropriate for your modem. Your ISP may be able to assist you, or you can teach yourself the proper initialization string by studying the AT command guide provided with your modem or available online from the manufacturer.
- c. Ask your ISP whether different modems are available via an alternate dial-in number, or switch to an ISP that provides different modems (call them first, as they may already know of issues they are having supporting the modem you are using). Perhaps borrow a friend's Internet account, obtain a trial membership with another ISP, or **connect to a PPP test server** if you know of one. If all else fails, you may wish to go so far as to try a different modem yourself--one that your ISP recommends for best compatibility.

Step Six: Reduce signal interference & distortion

The telephone network path between modems must be sufficiently free of noise and frequency distortion to permit a stable connection. The modem analyzes these line impairments as they affect the quality of the transmission signal. Poor signal quality causes transmission errors, reduced throughput, reduced connection speed, and dropped connections.

- a. Experiment with eliminating potential sources of line impairments in the home:
 - o Any device connected to any telephone outlet, especially if used by the modem, and even if on a different line: telephones, including cordless telephones and their base stations, answering machines, fax machines, caller ID boxes, and other modems

..TIL24803-Troubleshooting_Unreliable_Modem_Connections.pdf

- Telephone line splitters, cable extenders, faulty or overly long telephone cables (shorter is better)
- Surge protectors, including those that offer telephone line protection
- Alarm systems, especially those that are connected to the telephone system
- Computer equipment, including speakers
- Fluorescent light fixtures and light dimmers
- Satellite dish receivers
- Appliances such as air conditioners, refrigerators, dryers, microwave ovens, and televisions
- Any AC power source and related cabling
- All other things electrical, including problems with the premises wiring: loose or corroded connections, too many splices or bridges, insulation deterioration and exposed wiring, non-twisted pair telephone wiring

Start with a direct, unobstructed, modem-to-outlet connection using a short, high-quality telephone cable. As a way of confirming the problem prior to isolating it any further, there is the option of testing with a direct connection to the external telephone box located at the back or side walls of the residence. It provides one or more standard telephone jacks supplying the home telephone connections but bypassing most impairments inside.

b. Listen for noise. Because the telephone company is only obligated to provide voice-quality phone lines, it is unlikely to address the many and varied off-premises sources of line impairments that can affect the connection but don't cause audible noise. Connect a telephone to the wall jack used by the modem, then pick up the line, dial the number 1 to stop the dial tone, and listen. Contact the telephone company if the line is not quiet (loud hiss, pops, static, voices), but first disconnect other telephone devices and check again.

c. Use a local dial-in number to your Internet Service Provider. Long distance and 800 numbers aren't typically a concern, but may cause the call to be routed through more facilities, indirect paths, and different carriers with different types of equipment and lines. Local calls may be auto-forwarded in the same manner, but most reputable ISP's don't engage in this practice.

If daunted by these varied and uncertain possibilities, consider carrying the computer to a local Apple service provider for testing on analog lines of confirmed quality.

Step Seven: Configure the Extensions Manager control panel for Mac OS All

Realistically, these last two steps are unlikely to address this particular kind of problem. Nevertheless, the possibility that extensions troubleshooting or clean installing will resolve is one that cannot be discounted, so be sure to try these if all else fails.

a. Open the Extensions Manager control panel and select whichever Mac OS All set is available from the Selected Set menu. For example: Mac OS 8.6 All, iMac All, and so on.

b. If the modem requires any of its own extensions (excluding fax or telephony extensions), ensure they are installed and enabled. Enabled extensions show an "x" in the adjacent checkbox. Extensions Manager will ask to duplicate the Mac OS All set before additional extensions can be enabled. Allow it to do so.

Of the modems that shipped with Apple computers, the following require the extensions listed in order to respond:

Modem	Extensions
Apple 56K modem (but not Apple/GV 56K modem)	iMac Modem Extension, PowerMac G3 Modem, or PowerBook G3 Series Modem, depending upon the computer
Geoport Telecom Adapter	Apple Telecom Modem, Express Modem Tool, Geoport for Power Macintosh, Geoport Telecom Adapter, Geoport Serial Driver, Serial Extension (PM 6100/7100/8100 only), Shared Library Manager, Shared Library Manager PPC, and the Express Modem control panel
PowerBook 3400/G3 Internal Modem/Ethernet 33.6 card	PowerBook 3400 Ethernet extension and PowerBook 3400 Modem extension, or just the PowerBook 3400/G3 Modem extension

c. Close Extensions Manager and restart the computer. If the symptom does not recur, perform extensions troubleshooting to isolate the problem extensions. It may only be necessary to correctly configure the software that used them.

Step Eight: Perform a Clean Install or Clean Restore

The Mac OS may be damaged. Perform a clean install or clean restore of the operating system. If there is any connectivity software or modem software to be installed separately, do so immediately afterward. If the problem continues, there is likely a hardware problem requiring service.

TITLE

Power Macintosh G3: Processor Module Jumper Blocks

Article ID: 24846
Created: 3/12/99
Modified: 1/11/00

TOPIC

*** RESTRICTED: Apple Internal and Support Providers Only ***
Not For General Public Release

This article lists the jumpers that are required for each processor module in the following Power Macintosh G3 computers:

- Power Macintosh G3 All-in-one
- Power Macintosh G3 DeskTop
- Power Macintosh G3 MiniTower
- Power Macintosh G3 (Blue and White)
- Macintosh Server G3 (Blue and White)

The correct color jumper must be installed for each processor or the computer will not operate properly. Refer to the "Processor Module" Take Apart topic in the appropriate Power Macintosh G3 service manual for installation instructions.

DISCUSSION

Power Macintosh G3 Processor Module Jumper Blocks			
Product	Processor Speed	Color of Jumper Block	Service Part Number(1)
Power Macintosh G3 All-in-one	233 MHz	red	076-0716
	266 MHz	white	076-0717
Power Macintosh G3 DeskTop	233 MHz	red	076-0716
	266 MHz	white	076-0717
	300 MHz	black	076-0737
Power Macintosh G3 MiniTower	233 MHz	red	076-0716
	266 MHz	white	076-0717
	300 MHz	black	076-0737
	333 MHz	green	076-0750
Power Macintosh G3 (Blue and White)	300 MHz	black	076-0759
	350 MHz	blue	076-0760
	400 MHz	white	076-0758
Macintosh Server G3 (Blue and White)	300 MHz	black	076-0759
	350 MHz	blue	076-0760
	400 MHz	white	076-0758
Notes: 1. Each jumper block kit includes a warranty sticker, which must be applied for the warranty to remain intact.

TITLE

Modem Dials Automatically

Article ID: 24877
Created: 4/15/99
Modified: 4/15/99

TOPIC

My modem automatically dials up my Internet service provider after I sign off. How can I stop this behavior?

DISCUSSION

An application or control panel setting can be set to automatically connect to the Internet.

To stop this behavior, check the following items:

- Remove the start up file in the Startup Items folder.
- Open the Remote Access control panel and click the Options... button; an Options window will appear. Click the Protocol tab, then select the PPP protocol. Click the "Connect automatically when starting TCP/IP applications" checkbox to deselect this option. Close the Remote Access control panel.
- Open the TCP/IP control panel. Verify that the User Mode is set for Advanced. (The User Mode can be set by selecting User Mode... in the Edit menu.) Click the Options... button; an Options window will appear. Click the "Load only when needed" checkbox to select that option.
- Turn off File Sharing and Web Sharing.
- Check the e-mail application settings.

Quitting the web browser is not necessary if the above settings are correct.

TITLE

PowerBook G3 Series: Upgrading Memory

Article ID: 25002
Created: 9/27/99
Modified: 9/27/99

TOPIC

This article provides the necessary information for upgrading memory in the PowerBook G3 Series computer. These directions are taken from the PowerBook G3 Series User Manual, Chapter 4, titled "Installing a RAM Expansion Card And Removing Your Hard Disk."

DISCUSSION

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, please see the following Tech Info Library article:

Article 24604: "[PowerBook G3 & G3 Series: Identifying Different Models](#)"

For information on upgrading memory in a PowerBook G3 Series (Bronze keyboard) computer, see the following Tech Info Library article:

Article 58325: "[PowerBook G3 \(Bronze keyboard\): Upgrading Memory](#)"

Warning: To avoid damage to your computer, Apple recommends that only an Apple-certified technician install additional RAM. Consult the service and support information that came with your Apple product for instructions on how to contact an Apple-authorized service provider or Apple for service. If you attempt to install additional RAM yourself, any damage you may cause to your equipment will not be covered by the limited warranty on your computer. See an Apple-authorized dealer or service provider for additional information about this or any other warranty question.

Getting Ready

Before you open your computer, make sure that you have a Phillips or a Torx T-8 screwdriver (available from a hardware or electronics supply store).

Removing the Keyboard and Internal Heat Sink

The design of your Macintosh PowerBook allows you to easily access the internal components of the computer by removing the keyboard. The steps in this section explain how to remove the PowerBook keyboard and internal heat sink to access the RAM expansion slot.

Step One

Place your PowerBook on a hard, flat surface.

Step Two

If your PowerBook is turned on, press the Power button. In the Shut Down dialog box, click Shut Down.

Warning: The internal components (including the internal heat sink) of your PowerBook may be hot. If you have been using your PowerBook, wait 10 minutes before continuing, to let the internal components cool down.

Step Three

Unplug the power adapter and any other devices from the back of your PowerBook. Unplug any phone line from the internal modem.

Step Four

Adjust your display so that it is at a 90-degree angle to the computer.

..TIL25002-PowerBook_G3_Series_Upgrading_Memory.pdf

If your display is tilted too far back, your PowerBook may tip backward when the expansion bay modules are removed in the next step.

Step Five

Pull out both expansion bay release levers to eject the modules or batteries in both the expansion bays.

Step Six

Remove the modules or batteries from both the expansion bays.

Step Seven

With your thumbs positioned slightly below the keyboard, place your fingers inside the expansion bays and locate the small plastic tabs that hold the keyboard in place. The plastic tabs have small ridges on them and are located on the underside of the top shell of the PowerBook approximately one inch inside each expansion bay.

Step Eight

Slide the plastic tabs toward you until you see the lower portion of the keyboard pop up.

Step Nine

Lift the lower portion of the PowerBook keyboard up slightly and pull it back enough to displace the five metal tabs that hold the front of the keyboard in place.

Step Ten

Flip the keyboard over and lay it on the palm rests and trackpad.

Step Eleven

Remove the two screws that secure the internal heat sink (using a Phillips or Torx T-8 screwdriver) and then lift it up by pulling on the small metal tab.

Warning: The PowerBook internal heat sink may be hot. If you have been using your PowerBook, wait 10 minutes before continuing to let the internal components cool down.

You now have access to the internal components of your PowerBook.

Installing A RAM Expansion Card

To install a RAM expansion card in your PowerBook, follow these steps:

Important: Make sure that the RAM expansion card you are installing is made for your Macintosh PowerBook model. Components designed for other PowerBook models will not work with your computer.

Step One

Locate the empty RAM expansion slot. See Figure 6.

Note: If you ordered your PowerBook with additional memory, this slot may already have a RAM card installed.

Step Two

Gently touch the metal surface on the right side of the inside of the computer to discharge any static electricity built up on your body. This prevents damage to your Macintosh PowerBook or RAM card.

Don't walk around while installing the card. If you do, touch the metal surface again to discharge any static electricity.

Step Three

Position the RAM expansion card at a 30-degree angle. Line up the notch in the PowerBook RAM expansion card with the small tab in the RAM expansion slot.

Step Four

Push the RAM expansion card into the plastic expansion slot. You may feel some resistance. If you are having trouble inserting the card, try pushing one side at a time.

Step Five

Gently push the RAM expansion card down until the two snaps on either side of the card lock into place.

Your RAM expansion card is now ready to use.

Replacing the Keyboard and Internal Heat Sink

Follow the steps in this section to replace your PowerBook keyboard.

Step One

Insert the internal heat sink and replace the two screws to secure it in place.

Step Two

Press down on the bottom portion of the heat sink to secure it into place.

Step Three

Flip the keyboard back on top of the opening in your PowerBook.

Step Four

Insert the five small tabs at the top of the keyboard into the opening in the PowerBook case.

Step Five

Press down on the lower portion of the keyboard until it snaps into place.

Step Six

Replace the expansion bay modules.

You are now ready to start working with your PowerBook again.

Warning: Never turn on your PowerBook G3 Series computer unless all of its internal and external parts are in place. Operating the computer when it is open or missing parts can be dangerous, and can damage your computer.

TITLE

Mac OS 8.0 & 8.1: Clean Install Instructions

Article ID: 26055
Created: 1/19/98
Modified: 7/13/98

TOPIC

Is there any shortcut for doing a clean system folder install in Mac OS 8? I would like to do this without having to remove the Finder or System file and renaming the system folder.

DISCUSSION

Purpose of a Clean Installation

A normal system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving all files in place, and forcing the Installer to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It is also useful in troubleshooting.

Clean Install Instructions

Follow these instructions in the order presented.

Starting from the Mac OS 8 CD

1. Insert the Apple Macintosh CD in the CD-ROM drive.
2. Restart your Macintosh.
3. As soon as you hear the startup chime, hold down the letter 'C' on the keyboard until you see the "Welcome to Macintosh" message.
4. As the computer starts up, you should see the "flying CD" background pattern- this will confirm that you are starting from the CD.
5. If the computer does not start from the CD, shut down the computer, turn on the computer and immediately hold down the Command-Option-Shift and the large Delete key simultaneously. Hold down these keys until you see the "Welcome to Macintosh" message.
6. If you receive a system error while starting from the CD, please see the section entitled "Cannot Boot from Mac OS 8 CD When AppleTalk is Off" in Tech Info Library article 24160: "**Mac OS 8: Late Breaking Information.**"
7. At the desktop, the Apple Macintosh CD's icon should be in the upper-right corner of your screen with your hard drive's icon below it. If any other hard drive appears above the Apple Macintosh CD, go to the Control Panels under the Apple Menu, open the Startup Disk item, select the Apple Macintosh CD, close all open windows and restart. The Apple Macintosh CD should then appear above the hard drive.
8. If you have successfully started from the Mac OS 8 CD, double click the "Mac OS Install" icon or the "Install Mac OS 8.1" icon, then proceed to the section entitled "Installing Mac OS 8".

Starting from the Disk Tools diskette

Note: These steps require a Mac OS 8 CD and Apple CD ROM drive.

1. Shut down your Macintosh computer.
2. Insert the appropriate Disk Tools diskette in the floppy drive, and turn on the computer. At the desktop, the Disk Tools floppy disk's icon should be in the upper-right corner of your screen with your hard drive's icon below it.
3. Disk Tools Disk 1 is designed for use with all non-PowerPC machines except the PowerBook 190.

4. Disk Tools Disk 2 is designed for use with all PowerPC computers and the PowerBook 190.

5. Insert the Mac OS 8 CD and double click the "Mac OS Install" icon or the "Install Mac OS 8.1" icon, then proceed to the section entitled "Install Mac OS 8".

Starting from the Install Me First diskette

1. Shut down your Macintosh computer.
2. Insert the Install Me First diskette in the floppy drive, and turn on the computer. The installer program will launch automatically on startup.

Installing Mac OS 8

1. The "Welcome" screen will come up. Click the Continue button.
2. When the "Select Destination" screen comes up, select the appropriate disk in the Destination Disk pop-up menu.
3. Check the box marked "Perform Clean Installation", then click the Select button.
4. Read the Important Information on the next screen and click Continue.
5. Read the licensing agreement and click Continue.
6. At this point you may customize your installation. Refer to your Mac OS 8 manual for descriptions of the optional components listed.
7. If you are using a non-Apple hard disk, click the Options... button and uncheck the Update Apple Hard Disk Drivers option. It is very important that you check with the vendor of your non-Apple hard disk to confirm that your hard disk driver will be compatible with Mac OS 8 before you start the installation.
8. Click the start button. The installer will check your hard disk and attempt to repair any problems that it finds. If it is unable to repair them, you should back up the hard disk and reinitialize it using the appropriate formatting utility for that drive. For Apple drives, use Drive Setup.

When you are finished with the installation, restart the computer. If you started from the diskette, it will be ejected, however if you started from the CD-ROM you may need to eject the Mac OS 8 CD.

Troubleshooting

These steps assume you are using the Clean Install of system software for troubleshooting purposes.

1) Verify Problem Resolution

2) After performing a clean installation, verify that you resolved the problem before adding anything to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of performing a clean installation.

3) Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Previous System Folder") such as fonts, extensions, and control panels. If possible, you should reinstall these items from their original disks.

If the original disks are not available, you may move the nonstandard items from the Previous System Folder to the new System Folder. Be careful not to replace anything that is already in the new System Folder. Only move items that are not already in the new System Folder. Open each corresponding folder within the System Folder and the Previous System Folder and then compare the contents. Move up to 5 items that are not already in the new System Folder and its sub folders from the Previous System Folder and its sub folders.

Restart your Macintosh.

Verify that the Macintosh is still starting up properly and that basic functions are working properly.

Repeat Steps 2-4 until all non-standard items have been moved from the Previous System Folder to the new System Folder.

4) Final Steps

Verify your applications are performing normally. If not, refer to the application manual or contact the vendor. When the Macintosh behaves as expected and you are sure that all needed items from the Previous System Folder are transferred or reinstalled, move the Previous System Folder to the Trash, and choose Empty Trash from the Special menu.

Document Information

Product Area: Mac OS System Software

Category: Mac OS 8.0

Sub Category: General Topics

APPLE NEED-TO-KNOW CONFIDENTIAL: Do NOT forward, copy, or otherwise replicate or disseminate verbally, electronically, or in hardcopy (except to those individuals within your organization who have a legitimate business need to know the information, and who have agreed in writing, to keep it confidential), unless Apple has given prior written authorization.

Mac OS 8: About Mac OS 8 Read Me

TOPIC

This article is the About Mac OS 8 Read Me file.

DISCUSSION

This document provides information about Mac OS 8 that supplements the information in your installation manual. Read this document for information about known problems with this release and possible solutions.

Known problems and compatibility issues

Apple Language Kits & Mac OS 8

Apple's Language Kits require an updater for full functionality with this version of the Mac OS. The Language Kit Updater for Mac OS 8 can be downloaded from the software updates area of Apple's Web site, America Online, and other sites where Apple updates are available.

If you cannot obtain the Language Kit Updater right away, do the following as an interim method of improving compatibility: After installing Mac OS 8, open the Installer again and add the International components of the basic system software. (See Adding and Removing Software in Chapter 3 of the installation manual.) Then reinstall your Apple Language Kit software. If the Language Kit installer asks about older files, always choose Newer.

At Ease and Mac OS 8

Some of the Mac OS 8 control panels can't be enabled for At Ease users and won't appear in At Ease Setup. You should use these control panels in the Finder before running At Ease. Also, note

that At Ease does not support file sharing. Do not turn on file sharing when using At Ease or your computer may freeze.

Apple Location Manager and Mac OS 8

To use the Apple Location Manager with your PowerBook computer, you must install Apple Location Manager 1.0.1, which is included with Mac OS 8. Due to changes in Mac OS 8, previous versions of Apple Location Manager will not function correctly and should not be used.

Programs refuse to open

Some programs refuse to run if the system font is set to anything but Chicago. To change the system font, use the Appearance control panel and change the font from Charcoal (the default) to Chicago then restart your computer and try to open the program again. Contact the manufacturer of the program to see if an updated version is available.

Additionally, some programs might require a small amount of additional memory when used with Mac OS 8. If a program refuses to open, increase its minimum memory allocation by 200K or 300K. To do this, select the program's icon, then open the File menu and choose Get Info. See the Memory topic in Mac OS Help for more information.

Printing with a LaserWriter Select 300 or 360 printer

If you experience system freezes or other problems when printing on a LaserWriter Select 300 or 360 printer, make sure the printer is connected to the computer. Trying to cancel printing does not solve the problem and may cause a flashing error message or cause your computer's performance to slow down.

Using Mac OS 8 with HP Printers

If your computer freezes or crashes when you use the Page Setup dialog box, contact Hewlett-Packard to obtain updated drivers for your printer.

Enhanced CDs stop playing

Audio tracks on Enhanced Compact Discs may stop playing if you open a program, access a file, or use the Finder. Enhanced CDs contain both audio and data information, such as text, movies, or multimedia software. On occasion, the Finder needs to access information about the data portion of the CD, which causes the audio to stop playing. This problem does not occur with standard audio CDs.

Apple Telecom software

The Apple Telecom software provided in the CD Extras folder on the Mac OS 8 CD is for PowerPC computers only. Also, the Apple Fax Gateway is no longer supported and will be removed when you install the new version of Apple Telecom.

If you already have an earlier version of Apple Telecom installed on your computer, a regular installation of Mac OS 8 does not remove or alter it. However, if you perform a clean installation of Mac OS 8, you will need to reinstall Apple Telecom software. If you have a PowerPC computer, use the installer on the Mac OS 8 CD. If you have a 68040-based Macintosh, reinstall your previous version.

Note: If you have a 68040 (or earlier) Macintosh, do not install the Apple Telecom software included with Mac OS 8.

Express Modems and GeoPort Adapter

If you have an Express Modem or GeoPort Adapter, and a 68040-based Macintosh, you may experience unexpected disconnections when accessing the Internet, the Internet Registration Server, and online services. External modems that do not use the Apple Telecom software will not experience this problem.

Internet Setup Assistant and static IP addresses

If you perform a clean installation of Mac OS 8, and you are connected to the Internet via a LAN (instead of a modem connection) and you have a static IP address, you should set the AppleTalk control panel to use Ethernet before using the Internet Setup Assistant. This is necessary so the assistant can update your configuration settings with the information you enter. After you use the assistant, open the TCP/IP control panel to activate TCP/IP for your computer.

Desktop Printing Extension and Mac OS 8

The Desktop Printing Extension is unnecessary with Mac OS 8. If it is present in the Extensions folder it may cause a system crash when you startup your computer.

ATI Xclaim GA and 3DMF files

If you have an ATI Xclaim GA card and your computer freezes when the monitor is set to Thousands of Colors and you try to load a QuickDraw 3D (3DMF) file, remove the Graphics Accelerator 1.0.7x extension from the Extensions folder. This extension is installed by the ATI Installer but is no longer

needed with Mac OS 8.

ProDOS disks and File Sharing

Turn off File Sharing before accessing a ProDOS (Apple II) disk or hard drive.

Or, if you are using a

ProDOS disk, eject it before turning File Sharing on. The Finder will be less responsive when you

access ProDOS disks, and may freeze when ProDOS disks and File Sharing are used together.

Macintosh Tutorial

If you have the Macintosh Tutorial, parts of it may not work correctly on computers with 68040

processors and Mac OS 8. Additionally, due to changes in the Finder and other parts of Mac OS 8,

the information in the tutorial may not be correct. You can use the Mac OS Info Center to learn about

the capabilities of your computer.

IR File Exchange Guide

The Apple Guide for the IR File Exchange control panel does not recognize when the File Sharing

control panel is open. You can avoid this problem by setting your owner name in the File Sharing

control panel, or by using the Mac OS Setup Assistant.

Using old versions of Cyberdog with international text

Using Cyberdog 1.2.1 or earlier to send or receive non-Roman text in e-mail messages may result

in information being lost from the end of the message. Cyberdog 2.0, included with Mac OS 8,

solves this problem.

AppleScript and the Finder

Many of the new features of the Mac OS 8 Finder are scriptable, and some of the properties in

previous versions of the Finder have changed. Additionally, some scripting capabilities have been

removed from the Finder and placed into scriptable control panels. For example, you can now script

file sharing by addressing the File Sharing control panel directly. These changes might require

some scripts to be updated for use with Mac OS 8.

Recording scripts and Mac OS 8

When you record an AppleScript using the Script Editor, Mac OS 8 does not properly record name

changes. For example, when you turn on recording in the Script editor and then change the name of

an icon in the Finder, the script will incorrectly record as: set «class» of item "folder name" to "folder name."

The correct recording should be:

1. select item "folder name"
2. set name of selection to "new folder name"

To work around this problem, edit the script after you record it. Change the wording as shown above, substituting the correct names.

AppleShare IP 5.0 servers and Mac OS 8

Apple recommends that you use Mac OS 7.6 with AppleShare IP 5.0 servers. If you use Mac OS 8,

you may encounter problems with FTP access. When several FTP clients try to access the same file

simultaneously, the clients may receive one of several error messages and the server may stop

serving files properly, or may crash when you shut it down. To avoid this problem until a fix is

available, you can turn off FTP access using the AppleShare IP Web & File Admin application. For

the latest information on AppleShare IP 5.0 support for Mac OS 8, see the AppleShare IP web site at

<http://appleshareip.apple.com>.

Miscellaneous notes

Internet access in Canada

If you don't already have an account with an Internet service provider, you can obtain one using the

Internet Setup Assistant, or you can choose one from the list in the International Internet Access file

in the Internet Extras folder on the Mac OS 8 CD. Read this information before using the Internet

Setup Assistant.

Internet access in Latin America, Australia, New Zealand, and Asia

If you don't already have an account with an Internet service provider, see the file International

Internet Access in the Internet Extras folder on the Mac OS 8 CD for important information. Read this

information before using the Internet Setup Assistant.

Installing the Internet Utilities

If you use your computer for sending e-mail, you should install the program DropStuff. DropStuff will

install the StuffIt Engine that allows Claris EMailer to compress and send files via e-mail. The

DropStuff installer is located in the Aladdin folder of the Internet Utilities folder, in the Internet folder

on your hard disk.

General Controls, Empty Trash Warning, and Views settings

These settings are restored to their default values after installing Mac OS 8. Additionally, in previous versions of Mac OS, view settings such as snap to grid and calculate folder size applied to all folders. When you install Mac OS 8 your previous setting is used as the default, but you can now select different settings for each of your folders and the desktop.

If you use a disk with Mac OS 8, and then use it on a computer with a previous version of the Mac OS, you'll notice that some of your views may change. For example, if you set a folder to view by button, then access that folder with System 7.6, the files will be displayed in large icon view because button view is not available under the older system software. Additionally, if you ejected the disk with open windows on a Mac OS 8 computer, the windows will not automatically reopen on older versions of Mac OS.

Unusual or inconsistent appearance

Some applications will exhibit unusual or inconsistent cosmetic anomalies when used with Mac OS

8. These are harmless, but if they bother you turn off the system-wide setting in the Appearance

control panel. Contact the manufacturer of the program to see if an updated version of the program is available.

Entering comments for floppy disks

With Mac OS 8 you can no longer enter comments in the Get Info window for floppy disks. The space

formerly used for storing comments is now used by Mac OS 8 to store the view settings (button view, etc.) for the disk and its folders.

Stationery pads and Mac OS 8

If you use a stationery pad with an application that does not directly support stationery, Mac OS 8 will

automatically make a new copy of the stationery and open it using the application. In previous

versions of Mac OS, you were asked to enter a name for the new copy; now it is opened as an

untitled document automatically.

Disk cache setting and better performance

If opening windows, emptying trash, and other activities in the Finder seem very slow, increase the

size of the disk cache. Click the Use Defaults button in the Memory control panel to set the cache to

the minimum recommended size for your system. With Mac OS 8, you can perform many file-related

activities at the same time, and increasing the size of the disk cache will help

performance.

Using Desktop Pictures

If you select a desktop picture that is on a CD or external disk, the picture might not be available the next time you start up your computer and will not be displayed. You can prevent this by copying the picture you want to display to your hard disk.

Slow screen redrawing

If the desktop is redrawn slowly after closing a window, your computer might be running low on memory. Set Desktop Pictures to display a pattern, instead of a picture, to speed up the redrawing process.

PowerBook 2400 computers and OT/PPP

After installing Mac OS 8, the printer/modem port may be in use by AppleTalk. If you also install OT/PPP, you must turn off AppleTalk then restart your computer in order to release the port for use by OT/PPP. Turn off AppleTalk using the AppleTalk control panel. Then restart the PowerBook and select the modem/printer port in the OT/PPP control panel.

Using Acrobat PDF documents

Some of the manuals included with Mac OS 8 are in Adobe Acrobat format. These files have pdf at the end of their names. To view or print these documents you must install Adobe Acrobat Reader, located in the CD Extras folder on the Mac OS 8 CD.

QuickTake Image Access

When you are copying pictures from a QuickTake 100 or QuickTake 150 camera to your computer, make sure all the pictures you want have finished copying before you erase the contents of the camera. Previously, you couldn't erase the camera until copying was completed. With Mac OS 8, you can copy and delete files at the same time so it's possible to accidentally erase the pictures before they have been copied. You cannot recover a picture once it is erased from the camera.

QuickTake 150 software installs old version of QuickTime PowerPlug

Mac OS 8 includes a new version of the QuickTime PowerPlug for computers with PowerPC microprocessors. The QuickTake 150 installer replaces this with version 2.0. Remove the QuickTime PowerPlug file from your Extensions folder (inside the System Folder) before installing QuickTake 150 software. After the QuickTake software is installed, drag the PowerPlug file back to

the Extensions folder.

Using a RAM disk

On some models of Mac OS-based computers, RAM disk contents are saved by writing to the hard disk when the computer shuts down. Then the contents are reloaded at startup. If the RAM disk is large, this may result in a delay when you shut down or start up your computer.

Apple HD SC Setup program

After you install Mac OS 8, you cannot use the obsolete Apple HD SC Setup program to initialize your hard drive. Use the Drive Setup program supplied with Mac OS 8 instead.

Apple CD-ROM and non-Apple CD-ROM incompatibilities

If your computer or CD-ROM drive is not manufactured by Apple, or you have an Apple CD-ROM drive which has been updated with a non-Apple driver, incompatibilities may result. To permit your CD-ROM drive to function correctly, remove Apple CD-ROM from the Extensions folder, and reinstall the software to support your CD-ROM device.

Network Software Installer version 1.5.1 installs older version of AppleTalk

The Network Software Installer installs an earlier version of AppleTalk than the one included with Mac OS 8. If an earlier AppleTalk version is installed, Open Transport networking software will not work. Do not use the Network Software Installer after installing Mac OS 8.

Password Security protects one partition only

The PowerBook Password Security control panel asks for a password in order to start up the computer. If you have formatted your internal hard disk so it has more than one partition, only the start up partition will be password protected. Additionally, if more than one partition has a System Folder, the PowerBook may start up from a non-protected partition.

Password Security on PowerBook 2400 and 3400 computers

The Password Security control panel is incompatible with Mac OS 8 on PowerBook 2400 and PowerBook 3400 computers. The security protection that the control panel provides works correctly on these PowerBook computers, but you cannot use the current version of the control panel to set up password protection. As an alternative, you can boot your PowerBook using a Disk Tools diskette, then open the Password Security control panel on your hard drive and turn password protection on, off, or set your password.

AutoRemounter control panel is for PowerBooks only

The AutoRemounter control panel automatically remounts network devices after a PowerBook

computer awakes from sleep. On desktop computers, network devices are not unmounted when the computer sleeps, so AutoRemounter is not needed.

Serial Port In Use error message on PowerBook computers with IrDA

If you receive an error message about the modem port being in use when you try to establish a PPP connection using OT/PPP, open the Infrared control panel and change the setting to IRTalk.

Switching between a LocalTalk network and a serial printer

If you use the same port to alternately connect to a LocalTalk network and a serial printer, the port is not always correctly released after you turn off AppleTalk to use the printer. If you have trouble printing after turning AppleTalk off, restart the computer.

3D images cannot be viewed with OpenDoc 3DMF Viewer 1.0.1 with QuickDraw 3D 1.5 or 1.5.1 installed

If QuickDraw 3D 1.5 or 1.5.1 is installed, a message about insufficient memory appears when attempting to place a 3D image in an OpenDoc document. Increasing the viewer's memory size with the Get Info command in the File menu does not solve the problem. To use the 3DMF Viewer, install an earlier version of QuickDraw 3D.

Internal speaker on Power Macintosh 5500 and 6500 computers remains muted after disconnecting external speakers

If the external speakers are connected when the computer starts up and then are disconnected, the internal speakers remain muted. To work around this problem, restart the computer after disconnecting the external speakers. The internal speaker should work normally.

Using Monitors & Sound with add-on devices

If you have a video or sound device that cannot be accessed using the Monitors & Sound control panel, use the Monitors control panel, or the Sound control panel, instead. Copies of these older control panels are installed in the Apple Extras folder on your hard disk. Unless you need to use these older control panels, use the unified Monitors & Sound control panel instead.

File Sharing and Users & Groups

If you want to be able to use the File Sharing and Users & Groups control panels from a remote computer, you must remove the FileSharing Commands scripting addition from the Scripting

Additions folder and turn on the Program Linking setting for both control panels.

File Sharing control panel and AppleShare

If you have AppleShare installed, some of the instructions about file sharing in the on-screen help will be incorrect. For instructions on network identity, file sharing, and activity monitoring, refer to the AppleShare documentation.

ARA 2.1 Personal Server and Users & Groups control panel

AppleTalk Remote Access Personal Server 2.1 cannot automatically open the Users & Groups control panel when you choose Users & Groups in the ARA setup menu. Instead, open the control panel by choosing it from the Control Panels submenu, in the Apple menu.

PowerBook 190, 190cs ,and 5300cs computers

The PowerBook 190cs and 5300cs display may appear blank when you first restart after installing

Mac OS 8, as well as every time after resetting PRAM. This is because the power manager is being

updated on the PowerBook. Restarting the PowerBook once more will result in a normal screen. To

shut down the PowerBook safely, press the Power button one time (which brings up the shutdown

dialog box) and then press the Return key.

Reinstalling printer drivers

If you perform a clean installation of Mac OS 8, and an icon for your printer is not available in the

Chooser, you may need to reinstall the software that came with your printer. If you have a StyleWriter,

StyleWriter II, or StyleWriter 1200, you can use the StyleWriter 1500 driver that comes with Mac OS 8

instead of installing your original printer software. If you have a Color StyleWriter 2200 or Color

StyleWriter 2400, you can use the Color StyleWriter 2500 driver instead.

Drive Setup and Energy Saver

Use the Energy Saver control panel to set the hard drive sleep setting to Never when you use Drive

Setup to perform an extended operation, such as testing the disk or initializing the disk with a low

level format or zeroing all the data. This will prevent errors caused by the hard drive spinning down

before Drive Setup completes its operation.

Mac OS 8 hard disks and older Macintosh computers

The hard disk driver software that the Installer places on Apple hard disks is not compatible with

computers that have a 68000 microprocessor. If you have an external drive with Apple driver

software connected to your computer when you install Mac OS 8, the updated driver software will cause an error if you connect that drive to a Macintosh Plus, Macintosh Classic, Macintosh SE, Macintosh Portable, or PowerBook 100 computer.

Using MacsBug and Mac OS 8

Mac OS 8 requires a new version of MacsBug. (MacsBug is a tool for software developers.) For information, check the Apple developer Web site at <http://devworld.apple.com>.

Advanced users can find additional technical information in the Mac OS 8 Tech Notes document.

This document is located on the World Wide Web at <http://devworld.apple.com/dev/technotes.shtml>.

Mac OS 8: About the English Text-to-Speech Software

TOPIC

This article is the Mac OS 8 English Text-to-Speech Software Read Me.

DISCUSSION

About the English text-to-speech software

With the English text-to-speech software installed, many Macintosh programs can read English text out loud. One of the programs that can read to you is the SimpleText program, which comes with this computer and is already installed on your hard disk. (You are probably reading this document using the SimpleText program.)

Technical details

The software that enables your computer to speak has these components:

Speech Manager, a system extension

one or more of these English speech synthesizers, depending on your hardware and software:

-
-
-

several voice files, each identified with one particular synthesizer
the Speech control panel

Software installation for different software releases

The Installer installs the files that are appropriate for your system.

Version 6.0.7 or 6.0.8

If you have version 6.0.7 or 6.0.8 of system software on any Macintosh, these files are installed:

Speech Manager, in the System Folder

MacinTalk 2, in the System Folder

9 voices, in the Voices folder, which is in the System Folder

Version 7.0 or later on 68040

If you have version 7.0 or later of system software on a Power Macintosh or on a Macintosh with a 68040 processor, the following files are installed:

Speech Manager, in the Extensions folder

the Speech control panel, in the Control Panels folder

MacinTalk 3 and MacinTalk Pro, in the Extensions folder

19 MacinTalk 3 voices, in the Voices folder, which is in the Extensions folder

3 MacinTalk Pro voices (Agnes, Bruce, and Victoria), also in the Voices folder

Version 7.0 or later on 68030

If you have version 7.0 or later of system software on a Macintosh with a 33 MHz or faster 68030 processor, the following files are installed:

Speech Manager, in the Extensions folder
the Speech control panel, in the Control Panels folder
MacinTalk 3, in the Extensions folder
19 voices, in the Voices folder, which is in the Extensions folder
Version 7.0 or later on other computers
If you have version 7.0 or later of system software on any other computer,
the following files are installed:
Speech Manager, in the Extensions folder
the Speech control panel, in the Control Panels folder
Note: On Macintosh SE computers, the Speech control panel requires version
7.1 or later of the system software.
MacinTalk 2, in the Extensions folder
9 voices, in the Voices folder, which is in the Extensions folder
Troubleshooting (problems and solutions)
My Macintosh won't speak.
Turn up the speaker volume in the Sound control panel.
Choose a voice that requires less random-access memory. The voices Agnes,
Bruce, and Victoria take the most memory.
The Installer program says there's a problem with the hard disk.
Re-install your system software, then try installing the English
text-to-speech software again.
The Installer program displays other error messages.
Make sure you restart the computer with extensions off, as described in
"Installing the Software," above.
I had an older version of text-to-speech software, then did a custom
installation of the new software, but some of my older voices disappeared.
The custom installation you chose erased the older version of the software
that can use those voices. You can install newer versions of the voices by
doing another custom installation of the new software to install MacinTalk
2 or MacinTalk 3, whichever you used to have. (If you are not sure which
you had, you can install both.)

Tech Info Library

Mac OS 8: About the Multiprocessing Software

TOPIC

This article is the About the Multiprocessing Software Read Me file that comes with Mac OS 8.

DISCUSSION

This document provides information about the multiprocessing software included with Mac OS 8 and how to configure your computer properly to take advantage of multiprocessor performance. You use multiprocessing software to use two processors at the same time, which increases your computer's speed.

Turn off virtual memory and do not install RAM Doubler
Turn off virtual memory in the Memory control panel, and do not install Connectix RAM Doubler software. If virtual memory is turned on or RAM Doubler is installed, then your multiprocessor-compatible software applications will not be able to take advantage of the second PowerPC processor.

To turn off virtual memory, open the Memory control panel. In the Virtual Memory section, click the Off button. Then restart your computer. For more detailed information about virtual memory, open the Help menu, then choose Help.

Turn off hard disk sleep
Make sure that the hard disk sleep interval is set to Never in the Energy Saver control panel. Otherwise, software applications designed to work with your multiprocessor computer may not work properly.

To set your hard disk sleep interval, do the following:

1. Open the Energy Saver control panel.
2. If necessary, click Show Details to make the additional options available.

3. Drag the top and bottom sliders all the way to the right as shown below.

If you wish, you can set a display sleep interval by dragging the middle slider. Display sleep works properly with multiprocessor-compatible software applications.

Important information about Document Auto-Save

The Energy Saver control panel contains a feature named Document Auto-Save. The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Mac OS (with new ones always arriving), Document Auto-Save may not be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When Document Auto-Save is incompatible with an application, it will either not automatically quit, or it will display alerts or dialog boxes that Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, it is recommended that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave open no documents that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel so the computer will sleep rather than shut down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Help from the Help menu when the Finder is active.

Mac OS 8: Open Transport 1.2 Read Me

TOPIC

This article is the Open Transport 1.2 Read Me article that is installed when you install Mac OS 8.

DISCUSSION

Introduction

This Read Me document contains late-breaking information about Open Transport compatibility, add-on software, and solutions to known problems with third-party software. For instructions about how to use the Open Transport control panels (AppleTalk and TCP/IP), see the Open Transport User's Guide. For additional technical information about Open Transport, see the Open Transport Technical Info file that came with Open Transport.

Contents

- What's new in Open Transport 1.2 - general
- Network interface options
- General compatibility
- Apple product compatibility update
- Dialup network connectivity - AppleTalk
- Dialup network connectivity - TCP/IP
- Native dialup network connectivity - TCP/IP
- Tips for SLIP and PPP configurations
- Known limitations and other issues

What's new in Open Transport 1.2 - General

- Fixes a TCP/IP crash often referred to as the Ping of Death.
- Provides improved TCP protection against denial-of-service attacks, otherwise referred to as SYN-attacks
- Improves overall performance of TCP when operating in a slow-link environment. This provides significant improvements for Web Servers where clients are using a modem to connect to an Internet Service Provider. This obsoletes the OTSlowLinkTuneUp Patch.
- Fixes a problem which could occur when AckSends were used without using

OTData

structures. While the data would be sent accurately, the buffer could be modified during the

operation, making the buffer unavailable for reuse. This problem was documented and

worked around in the OTVirtualServer sample code.

Fixes crashes which could occur with TCP applications, such as Netscape, when AppleTalk

was turned off. This problem was first noticed by America Online (AOL). This fix obsoletes

AOL's extension OpenOT.

Fixes a problem between native PAP and some HP LaserJet postscript printers.

Fixes a problem on some hardware platforms that would not permit multiple MDEVs located

in the Extensions folder to be initialized.

Fixes a problem where ADSP used via the native OT API could truncate outbound data if

some data was unsent when OTSndOrderlyRelease was called.

Fixes a rare crash in AppleTalk which could occur when a STREAMS buffer was freed twice.

Added support for the CompuServe PPP MDEV.

Multiple fixes to increase stability of AppleShare and AppleShare IP servers with more than

80 concurrently connected users.

Network Interface Options

Open Transport 1.2 supports PCI bus, NuBus, communications slot, and PC Card network interface

cards, as well as built-in LocalTalk, Ethernet, and Token Ring network adapters. For supported

computers without expansion options, Open Transport 1.2 also supports a SCSI-attached network

adapter. Third party network interface options available for Open Transport include Fast Ethernet, ATM, and FDDI.

General compatibility

Open Transport is compatible with:

existing applications that use AppleTalk as specified by Apple Computer, Inc.

existing applications that use MacTCP as specified by Apple Computer, Inc.

existing devices (such as printers) that you select in the Chooser
existing NuBus network interface cards for the Mac OS

Computers running Open Transport can be added to an existing AppleTalk or TCP/IP network

without upgrading other computers on the network.

Apple product compatibility update

At Ease version 2.x or 3.x may encounter problems when starting up with Open Transport. At

Ease Update 1.0 will update non-Workgroup versions of At Ease 2.x or 3.x to include Open

Transport compatibility. If you are using At Ease for Workgroups, you should upgrade to

version 3.0.2 or later. Both can be found on Apple Software Update sites on the Internet and

selected online services.

Assistant Toolbox version 1.2 is not compatible with Open Transport, and will result in

AppleTalk being turned off each time you restart your system. System 7.5 update 2.0 and

7.5.5 include Assistant Toolbox version 1.3 or later that is compatible with Open Transport.

The Apple PCI Token Ring Card (M3904Z/A) works with Open Transport 1.1.1 and later. The

Apple PCI Token Ring card is compatible with Power Macintosh 7200/120, 7300, 7500,

7600, 8500, 8600, 9500 and 9600 computers; it is not compatible with 7200/75 and 7200/90

computers.

Apple LaserWriter Bridge and LocalTalk Bridge 2.1 or later are compatible with Open

Transport.

Apple Internet Mail Server 1.1 or later software is compatible with Open Transport 1.1 and

later.

Apple Remote Access (ARA) Multiport Server 2.1, ARA Client 2.0.1, and ARA Personal Server

2.0.1 are compatible with Open Transport 1.1 and later.

Apple PCI-based Workgroup servers (Application, AppleShare, and Internet) are compatible

with Open Transport 1.1 or later.

Computers running the current versions of Apple IP Gateway and AppleTalk Internet Router

must not be updated to Open Transport; these products are based on classic networking.

These products do, however, interoperate with computers using either classic or Open

Transport networking. Apple has not yet announced plans regarding future versions of these

products.

Apple's MacTCP Ping is not compatible with Open Transport; no update is planned. MacPing

from Dartmouth, available at <ftp://www.dartmouth.edu/pages/softdev/>, OTTool from Neon

Software, available at <ftp://ftp.neon.com> and Mac TCP Watcher v2.0 from Peter N. Lewis &

Stairways Software available at <ftp://ftp.share.com> are Open Transport-compatible

alternatives.

ZapTCP is a classic networking tool and is neither compatible nor needed with Open

Transport. Functionality similar to ZapTCP is built into Open Transport.

Dialup network connectivity - AppleTalk

For dialup connectivity to AppleTalk networks, Open Transport supports Apple Remote Access

version 2.0.1 or later.

Dialup network connectivity: TCP/IP

For dialup connectivity to TCP/IP networks (including the Internet) Open

Transport supports

third-party extensions known as MDEVs. Serial Line Interface Protocol (SLIP) and Point to Point

Protocol (PPP) connectivity are provided in this manner. Not all versions of all MDEVs are

compatible with Open Transport 1.1 and later.

Open Transport 1.2 recognizes and is compatible with the following MDEVs. When properly installed

they appear in the Connect via pop-up menu in the TCP/IP control panel.

FreePPP version 1.0.5 or later

FreePPP is shareware and can be found on the Internet, typically at info-mac mirror sites in the

comm/tcp/conn directory. A list of info-mac mirror sites can currently be found at:

<http://www.pht.com/info-mac/mirror-list.html>.

Some sites where FreePPP can be found currently include:

<ftp://mirrors.aol.com/pub/info-mac/comm/tcp/conn/>, and

<ftp://mirror.apple.com/mirrors/Info-Mac.Archive/comm/tcp/conn/>.

FreePPP versions prior to 2.5 may experience problems when running with virtual memory turned

on (including RAM Doubler). If you have problems using FreePPP with VM, either update to FreePPP

2.5, or temporarily turn VM off. The current version of FreePPP is 2.5v3.

MacPPP version 2.1.4 or later (MacPPP 2.5 is recommended)

MacPPP versions prior to 2.5 may experience problems when running with virtual memory turned on

(including RAM Doubler). If you have problems using MacPPP with VM, either update to MacPPP 2.5,

or temporarily turn VM off.

An Open Transport-compatible version of MacPPP (MacPPP 2.5) is included in the Open Transport

Extras folder. For more information, please refer to the MacPPP Read Me document.

InterPPP version 1.2.9 or later; InterPPP II version 1.1 or later

InterPPP and InterPPP II are commercial software products. For availability and

ordering information

in the U.S., contact InterCon Systems at 800-468-7266 or 703-709-5500.

MacSLIP version 3.0.3 or later

MacSLIP is commercial software developed by Hyde Park Software. It supports both SLIP and PPP.

For availability and ordering information in the U.S., contact TriSoft at 800-531-5170 or

512-472-0744. For more details see the MacSLIP Web page at

<http://www.zilker.net/~hydepark/>.

Sonic PPP version 1.0.2 or later

SonicPPP is commercial software developed by Sonic Systems, Inc. For availability and ordering

information in the U.S., contact Sonic Systems at 408-736-1900 (voice)

408-736-7228 (fax). For

more details see the Sonic Systems Web page at <http://www.sonicsys.com/>.

NTS PPP version 2.0 or later

NTS PPP is commercial software developed by Network Telesystems, Inc. For availability and

ordering information in the U.S., contact Network Telesystems at 408-523-8100 (voice)

408-523-8818 (fax). For more details see the Network Telesystems Web page at

<http://www.ntsi.com/>.

SAT/SAGEM PPP version 1.02b1 or later

SAT/SAGEM PPP is commercial software developed by SAT/SAGEM. For availability and ordering

information in the US, contact SAT/SAGEM at 408-446-8690 (voice) 408-446-9766 (fax). For more

details see the SAGEM Web page at <http://www.satusa.com/>.

CompuServe PPP

CompuServe PPP is commercial software developed by CompuServe. For availability and ordering

information in the U.S., contact CompuServe Customer Service at 1-800-848-8990.

For more details

see the CompuServe Web page at <http://www.compuserve.com/>.

LeoTCP version 2.0.1 or later

LeoTCP is commercial software developed by Hermstedt GmbH. For availability and ordering

information in the U.S., contact Hermstedt USA at 1-800-828-5522 (voice). In

Europe contact

Hermstedt GmbH at +49 621-76500 (voice) +49 621-7650100 (fax).

T-Online CSLIP version 1.0.3 or later

T-Online CSLIP is commercial software developed by Computer Consulting GbR. For availability

and ordering information in Europe, contact format network & communication at +49 2206-95840.

For more details, contact format network & communication at info@format.de.

University of Michigan ISDN version 2.0.6 or later

In addition to these, there are a number of other MDEVs (examples include those from Pacer, FCR, and Tribe) which are indistinguishable from one another to Open Transport. When installed, these appear in the Connect via pop-up menu as TCP/IP PPP.

Native dialup network connectivity: TCP/IP

Open Transport supports extensions that use the STREAMS architecture. OT/PPP version 1.0 or later is available on the Apple Software Update sites on the Internet and requires Open Transport 1.1.1 or later.

Tips for SLIP and PPP configurations

Some MDEVs are known to be incompatible with other MDEVs. If you experience problems, remove unused MDEVs so that only one MDEV is installed on your computer at a time.

Users who dial into a TCP/IP network or Internet Service Provider (ISP) may have been assigned a router (gateway) address that is not a part of their local subnet. This was an accepted but technically invalid configuration for MacTCP. Open Transport users should not enter a value for the router address or subnet mask; Open Transport/TCP generates correct values for these fields automatically. In unusual circumstances, these supplied values can be overridden using the Administration mode of the TCP/IP control panel.

If BootP is used over SLIP or PPP for interface configuration, and if BootP returns additional default router addresses, Open Transport will automatically add those addresses to the list of default routers.

When Open Transport is installed on a computer that previously had MacTCP configured for a server configuration, the initial configuration method (the selection in the Configure pop-up menu in the TCP/IP control panel) is set for the use of a BootP server. This default may not be the appropriate choice for you; please verify.

If your computer was previously configured for MacTCP server addressing and you experience connection difficulties using PPP or SLIP after installing Open Transport, follow these steps:

1. Open the TCP/IP control panel.

2. Choose Using PPP Server or Using SLIP from the Configure pop-up menu.
3. Close the TCP/IP control panel, and save changes when prompted.
4. Try connecting again.

If your computer was previously configured for MacTCP manual addressing and you experience connection difficulties using PPP or SLIP after installing Open Transport, follow these steps:

1. Open the TCP/IP control panel.
2. Choose Manual from the Configure pop-up menu.
3. Verify that the correct IP address is entered in the Address field.
4. Close the TCP/IP control panel, and save changes when prompted.
5. Open the configuration utility supplied with your SLIP or PPP software, and verify that it also reflects the correct IP address in the appropriate location. Refer to the documentation supplied with your SLIP or PPP software for further information on how to enter an IP address, and how to save an updated configuration.
6. Try connecting again.

Note: In MacPPP's Config PPP control panel, this setting is entered in the IPCP dialog box. Refer to the documentation that came with MacPPP or FreePPP for additional information.

Known limitations and other issues

PowerBooks

The AppleTalk control panel displays separate printer and modem ports on the PowerBook 190.

LocalTalk will only work correctly when the modem port is selected in the AppleTalk control panel.

The software that dims the screen of PowerBook Duo computers when the PowerBook is docked

and idle is not compatible with Open Transport. Use a third-party screen saver in place of the Apple-provided module.

In some cases, on a PowerBook 190 configured to use the Infrared Port in the AppleTalk Connect

via pop-up menu, networking services may become disabled following a sleep/wake or restart. If

this happens, try putting the computer to sleep and waking it up again, or use the AppleTalk control

panel to temporarily select the modem/printer port before switching back to the infrared port.

Desktop Computers

On a IIcx or a Quadra 950, Open Transport can only use the compatible mode setting in the Serial Switch control panel. Do not use the faster mode setting with LocalTalk.

On 68030 and 68040 computers, changes in AppleTalk configurations can cause systems running Meeting Maker 3.5 or 3.5.1 to crash. This can occur when changing AppleTalk links, turning AppleTalk off, or bringing ARA connections up or down. This problem will occur on classic networking as well. Apple is working with ON Technology to resolve this problem.

Open Transport

Open Transport generally requires more memory (RAM) than MacTCP. To conserve memory, you might try some of the following:

- Rename or re-order one or more third-party extensions (INITs), to change the order in which memory is allocated when your computer starts up. If you use extensions from Global Village, try renaming those extensions so that they load last.
- Especially on PowerPC-based computers, turn on virtual memory. This may affect performance.

TCP/IP

When TCP/IP is set to Load only when needed (in the control panel's Options window), ping^{ing} an Open Transport workstation will fail if TCP/IP is not currently being used. To make sure your computer is pingable at all times, turn off the Load only when needed option (open the TCP/IP control panel and click the Options button, then click the Load only when needed checkbox to remove the X) and restart your computer.

When TCP/IP is set to Load only when needed (in the control panel's Options window), the first TCP/IP application opened will cause Open Transport to load into memory. Some older applications do not cause Open Transport to load, and then report errors similar to those encountered when MacTCP is not installed. If this is a problem, turn off the Load only when needed option (open the TCP/IP control panel and click the Options button, then click the Load only when needed checkbox to

remove the X) and restart your computer.

The TCP/IP control panel is able to obtain and utilize multiple gateway and name server addresses from DHCP and BootP servers. However, it will currently display only the first one in the list. This should be addressed in a future release.

Generally, you should turn on the Load only when needed option in the TCP/IP control panel when using a modem. If TCP/IP is always loaded (Load only when needed is not checked), your modem may attempt to initiate a dialup connection at startup. Some MDEVs require more system heap memory than is available at startup, which may cause the computer to hang. Also, some Internet service providers charge by connect time, so you may be charged for the connection, even if you were not using it.

You should only specify use of 802.3 framing in the TCP/IP control panel if you have been directed to do so by your network manager, or if you are sure that all other stations on your network segment, including your IP router(s), are also configured to use 802.3 and not Ethernet version 2.0 framing.

MacSLIP

If you use MacSLIP, you should likewise not configure the MacSLIP control panel to initialize MacSLIP at system startup time. As stated above, this may require more system heap memory than is available at startup, which may cause the computer to hang.

If you are experiencing problems when using MacSLIP with virtual memory on, increasing your virtual memory size may give you better results. (Use the Memory control panel to increase virtual memory.)

Netscape

If you are using Netscape, 16MB or more of built-in memory (RAM) is recommended.

MacTCP

Some MacTCP-based applications will not function correctly unless the MacTCP DNR file is in its original location at the root level of the System Folder.

Claris EMailer

Claris EMailer version 1.1 v3 or later and Claris EMailer Lite version 1.1 v4 or later is compatible with Open Transport 1.2. Earlier versions of Claris EMailer may not be

compatible with Open

Transport's Load only when needed configuration option. If you experience a system crash 2-3

minutes after quitting EMailer, turn off the Load only when needed option. (Open the TCP/IP control

panel and click the Options button, then click the Load only when needed checkbox to remove the X.)

MacTraceRoute Ethernet LAP

The current version of the MacTraceRoute Ethernet LAP does not work on computers running Open

Transport. This utility only works with Classic networking. Open Transport compatible alternatives

include Mac TCP Watcher v2.0 from Peter N. Lewis & Stairways Software, available at

<ftp://ftp.share.com>, and IP NetLink from Sustainable Softworks, available at

<http://www.sustworks.com/~psichel/>.

NFS/Share

NFS/Share versions 1.4.4 or later are compatible with Open Transport.

Netware Client

When using Netware Client version 5.11 configured for NetwareIP service, the first login may yield a

Netware Configuration error message. To avoid this error, open the NetwareIP control panel and

change the value under Domain SAP Server (DSS) Retry Attempts from 1 to 2. You can also change

OpenTransport TCP/IP control panel to always load TCP/IP into memory (open the TCP/IP control

panel, click the Options button, and click the Load only when needed box to remove the X).

eXodus

eXodus 5.2.2 and later are compatible with Open Transport.

Anarchie

Versions of Anarchie prior to 1.6 have a data corruption problem when used with Open Transport.

Make sure you are using Anarchie 1.6 or later.

Apple Remote Access

If an Apple Remote Access (ARA) user is on a non-routed, extended (Ethernet) network, and there

are devices on the local network with the same network number as devices on the remote network,

the user will not be able to see the local devices. This problem can be fixed by installing a router.

Another workaround is to clear the PRAM on the ARA computer. (Hold down the Command, Option,

and PR keys simultaneously while starting up the computer). Clearing PRAM causes the computer

to start up with a new network number, which should not conflict with the remote

network number.

Daemon

Daemon 1.0.0 & Daemon Killer 1.0 are not compatible with Open Transport.

MudDweller

MudDweller 1.2 is not completely compatible with Open Transport. You can open new connections, but the reconnect choice does not work correctly.

NetPresenz

The system will crash during launch of NetPresenz if Open Transport TCP/IP is configured to use MacIP and the selected zone has no MacIP server.

VersaTerm SLIP

Current versions of VersaTerm SLIP are not compatible with Open Transport.

KeyServer

Problems can occur with old versions of the KeyServer package from Sassafras Software when TCP/IP is configured to Load only when needed (in the control panel's Options window). Contact Sassafras for the latest revisions at <http://www.sassafras.com>.

Open Transport/LocalTalk Bridge/Global Village Toolbox/GlobalFax

The combination of Open Transport 1.2, LocalTalk Bridge 2.1f2, Global Village Toolbox and GlobalFax extensions causes a crash. This also happens when using classic networking. The workaround is to move the LocalTalk Bridge file to the Extension folder, renaming it to aLocalTalk Bridge. You can make an alias and rename the alias as desired. Put the alias wherever you want, including the Control Panels folder. This will allow the LocalTalk Bridge to load before Global Village and avoid the cause of the crash.

CSI Hurdler

To use the CSI Hurdler serial card with Open Transport, contact CSI to get a copy of their preference file patch. This will enable the card to be compatible with Open Transport 1.2.

MPW

The current official release of the MPW shell will hang the system when used with virtual memory and Open Transport. When using the MPW shell and Open Transport, turn off virtual memory. The ETO #21 pre-release MPW shell, version 3.4.2b2, fixes this problem.

- MacTCP server addressing support
- MacTCP dynamic addressing support

MacIP support
PPP connectivity

Memory requirements

Application compatibility guidelines

Performance

Introduction

Open Transport is modern networking and communications system software for the Mac OS. It is

based on industry standards and brings a new level of networking connectivity, control, and

compatibility to Mac OS computers, while preserving built-in support for easy-to-use networking.

Open Transport is supported on system software versions 7.1, 7.1.1, 7.1.2, 7.5.3, 7.5.5 or later.

System software version 7.5.3 or later is recommended. No other system software versions are supported.

For more important information about system requirements, compatibility, and known incompatibilities and limitations, read the About Open Transport 1.2 document.

Files added by the Open Transport installer

Open Transport installs the AppleTalk and TCP/IP control panels into the Control Panels folder

inside the System Folder of your startup disk. The Open Transport Installer also adds the following

files to the Extensions folder inside the System Folder:

Shared Library Manager, Shared Library Manager PPC

These extensions implement a shared library mechanism on 68K and PowerPC Mac OS computers, respectively. Both extensions are required on PowerPC-based computers in order to support both emulated and native shared libraries.

OpenTransportLib, Open Transport Library

These shared libraries implement core Open Transport services on PowerPC-based computers.

The first library contains the PowerPC implementation and an interface for native PPC applications.

The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

OpenTptAppleTalkLib, Open Tpt AppleTalk Library

These shared libraries implement Open Transport AppleTalk services on PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

OpenTptInternetLib, Open Tpt Internet Library

These shared libraries implement Open Transport TCP/IP services on PowerPC-based computers. The first library contains the PowerPC implementation and an interface for native PPC applications. The second library contains the built-in Open Transport modules and an interface for emulated 68K applications.

Open Transport 68K Library

This shared library implements core Open Transport services on 68030- and 68040-based computers.

Open Tpt ATalk 68K Library

This shared library implements Open Transport AppleTalk services on 68030- and 68040-based computers.

Open Tpt Inet 68K Library

This shared library implements Open Transport TCP/IP services on 68030- and 68040-based computers.

Open Transport AppleTalk Features

Static and dynamic AppleTalk address allocation
Open Transport AppleTalk supports static assigned (manually administered) protocol addresses as well as the dynamic addressing provided by AppleTalk Address Resolution Protocol (ARP).
Static addressing allows AppleTalk nodes to be managed using the protocol address as a unique and stable identifier.

It is important that all nodes on each individual AppleTalk subnet (a given cable segment assigned a unique network number or network number range) be administered consistently--either all with dynamic addressing or all with pre-assigned static addresses. This avoids a potential conflict when a new dynamic node acquires an address assigned to manually-addressed node that is not connected or is off line. Administrators can enforce the addressing policy for a subnet by locking the addressing mode. As a precaution, Open Transport AppleTalk checks for duplicate protocol addresses on the LAN even when static addressing is configured.

Use of parameter RAM

Under classic AppleTalk, AppleTalk's on/off state, the selected network interface, the previous network (protocol) address, and the previous AppleTalk zone name are saved in persistent memory (parameter RAM) for reuse at startup. To ensure backward compatibility, this information is still stored and retrieved on systems using Open Transport AppleTalk. However, the following differences are found with Open Transport:

At startup, Open Transport reads the current AppleTalk configuration file to determine if

AppleTalk should be turned on or off. This value overrides the value saved in parameter RAM.

The user is not explicitly notified when this occurs.

If the network interface specified in the current AppleTalk configuration file is locked and the

specified port is not available or cannot be initialized, Open Transport will not automatically

switch the port back to LocalTalk. Instead, AppleTalk will remain off.

The user sees a dialog

box with this information.

Open Transport TCP/IP features

Open Transport brings a workstation-class implementation of TCP/IP protocols to Mac OS. As with

MacTCP, Open Transport TCP/IP is a full 32-bit stack. Open Transport TCP/IP adds support for:

dynamic path MTU discovery, for more efficient network use in heterogeneous network

topologies.

Dynamic Host Configuration Protocol (DHCP), for centralized IP address configuration

management. DHCP is an Internet Engineering Task Force (IETF) standards-track protocol.

IP multicast, for participation as an Mbone client for applications

written to the native Open

Transport API.

simultaneous TCP connections for applications written to the native Open Transport API are

limited only by installed memory and processor power, for increased functionality as an

Internet or other TCP/IP network server.

a new, more robust and standards-compliant domain name resolver (a caching stub DNR).

support for developer access to raw IP services, as well as TCP and UDP.

Ethernet Version 2.0 and IEEE 802.3 framing, for better interoperability with a wider range of

TCP/IP hosts.

implicit and explicit domain name search paths, for increased control of domain name

resolution.

use of multiple IP routers with fail-over, for increased robustness in mission-critical

applications.

TCP wildcard source port assignments start at 2048, increasing from that point.

DHCP server support

Apple's implementation conforms to the current versions of the applicable specification documents

(RFCs). To date, Open Transport TCP/IP has been tested with the following DHCP server

implementations:

Competitive Automation <http://www.join.com>

FTP Software <http://www.ftp.com>

Hewlett Packard HP-UX <http://www.hp.com>

Microsoft Windows NT Advanced Server <http://www.microsoft.com>

Silicon Graphics <http://www.sgi.com>

Sun Solaris and SunOS <http://www.sun.com>

TGV <http://www.tgv.com>

DHCP address lease support

Open Transport TCP/IP supports DHCP address leases. Open Transport TCP/IP automatically

attempts to renew any address lease that reaches its renewal interval (by default, the renewal

interval is reached when the lease is halfway completed). The renewal interval may be configured to

a different value by making changes to the configuring DHCP server. Renewal is attempted

regardless of how many times the lease has already been renewed. Lease rebinding is also

supported. Should an interface's IP address lease expire, the interface is closed down. Open

Transport TCP/IP does not currently support the DHCP Client ID option or the DHCPINFORM

message, nor will it currently try to use the remainder of a previous but

unexpired lease upon
rebooting.

Windows NT advanced server support

With Open Transport 1.1 and later, Mac OS clients are interoperable with the Windows NTAS DHCP server on LAN links. However, Mac OS clients cannot acquire configuration information from an NT DHCP server across a dialup (PPP) link because there is not yet an accepted industry standard for DHCP over dialup. The NT implementation is based on proprietary Microsoft extensions. Mac OS clients cannot acquire configuration information nor register with a Microsoft WINS server. WINS is also dependent on Microsoft extensions to TCP/IP (requiring NetBIOS support).

The Internet Engineering Task Force (IETF) is developing a cross-platform industry standard technology for dynamic registration and look-up of IP names through the Dynamic Service Location working group. Apple has no current plans to implement the WINS extensions. Instead, we are fully committed to implementation of the applicable IETF standards as they emerge.

Macintosh clients running versions of Open Transport prior to 1.1 could experience some interoperability problems due to other significant differences between the Microsoft implementation and that of a typical UNIX-based server.

BootP support

Open Transport 1.1 and later fully supports Bootstrap Protocol (BootP). Versions of Open Transport prior to 1.1 failed to accept a BootP Reply sent to the unicast (subnet broadcast) address, (for example, xxx.xxx.xxx.255. Replies sent to the all-nets broadcast address (for example, 255.255.255.255) were handled properly. Also, earlier versions of Open Transport required that the BootP gateway be zero hops away.

Local Hosts file support

Open Transport TCP/IP supports a Hosts file that may be used to supplement and/or customize the Domain Name Resolver's initial cache of information. The Hosts file is normally stored in the Preferences folder in the active System Folder. When Open Transport TCP/IP is initialized, it reads the Hosts file (if any). As in MacTCP, the supported Hosts file features follow a subset of the Domain Name System Master File Format (RFC 1035).

Open Transport TCP/IP is more stringent regarding the content and format of the

Hosts file than was

MacTCP, which permitted violation of the FQDN requirement for <domain-name>. For instance, the format:

```
charlie      A      128.1.1.1
```

which was acceptable to the MacTCP DNR, is no longer permitted because of the use of domain

search lists in Open Transport/TCP (charlie could potentially exist in any or all of the configured

domains). To accomplish the same effect, use this format instead:

```
charlie      CNAME  myhost.mydomain.edu
```

```
myhost.mydomain.edu  A      128.1.1.1
```

This associates the local alias charlie with the fully qualified domain name myhost.mydomain.edu,

and resolves it to the address 128.1.1.1. Use of local aliases is limited to CNAME entries; NS and A

entries must use fully qualified domain names.

You can create a Hosts file with any text editor or word processor (the Hosts file must be stored in

text format). If you use a Hosts file, keep it as short as possible, and include only entries that will be

accessed frequently. This reduces the memory required to cache the DNS information and

minimizes the need to maintain and update Hosts files as system information changes.

Open Transport TCP/IP automatically uses a Hosts file stored in the Preferences folder of the active

System Folder. If no Hosts file is found in the Preferences folder, Open Transport TCP/IP searches

the active System Folder for a Hosts file. You can specify a particular Hosts file to use with a specific

configuration. For example, one Hosts file might be set up for a user connecting via Ethernet, and

another set up for when that user connects via modem.

For additional information about the Hosts file design of the Open Transport Domain Name

Resolver, see the document Apple Open Transport Reference Q&A. The latest version of the Q&A is

in the Open Transport Extras folder and is available on the Internet at <ftp://seeding.apple.com/ess/public/opentransport/>.

MacTCP server addressing support

Open Transport TCP/IP supports both Bootstrap Protocol (BootP) and Reverse Address Resolution

Protocol (RARP) configuration methods. MacTCP Server mode addressing was a

combination of

BootP and RARP. When Server mode was selected, MacTCP used BootP to attempt to acquire an IP address. If that failed, MacTCP tried RARP. Whichever protocol was successful was stored as a preference, and was used first the next time the computer started up. In Open Transport, you must choose BootP or RARP explicitly.

MacTCP dynamic addressing

Open Transport does not support MacTCP dynamic addressing. MacTCP dynamic mode addressing was based on an Apple-proprietary extension to TCP/IP protocols. It applied the address negotiation and assignment rules used by the AppleTalk protocols to TCP/IP networks, making it very easy to set up a Macintosh-only standalone TCP/IP network. Use of this dynamic addressing method in other scenarios, however, could create additional work for a network administrator.

The Internet community (IETF) has since developed a multivendor standard for the dynamic assignment of IP addresses, known as Dynamic Host Configuration Protocol (DHCP). Open Transport TCP/IP supports the industry standard DHCP.

MacIP support

MacIP is a protocol specification developed for carrying TCP/IP traffic on AppleTalk-only networks, originally LocalTalk networks. MacIP is today frequently used with AppleTalk Remote Access Protocol (ARAP) to provide mobile users access to TCP/IP network services.

Use of MacIP typically requires a gateway, which strips off the AppleTalk encapsulation and places the IP packet on the TCP/IP LAN. When packets are sent back to the MacIP end-node, the gateway replaces the AppleTalk encapsulation. MacIP gateway support is most frequently offered as an integrated service within a multiprotocol router. The gateway (router) attaches to both an AppleTalk and a TCP/IP network.

Open Transport supports MacIP in the TCP/IP control panel. Once selected, TCP/IP data is encapsulated in AppleTalk packets, and is sent through the selected network interface.

PPP connectivity

PPP (Point to Point Protocol) connectivity for Open Transport is currently based on the use of third-party software extensions known as MDEVs. Early versions of these

extensions may not be compatible with Open Transport. For information about MDEV compatibility, see the About Open Transport 1.2 document.

Memory requirements

Open Transport provides many new features and capabilities to Mac OS customers and, in general, will require more system memory (RAM) than does classic networking. However, the actual memory requirements of Open Transport vary depending upon the networking services in use at a given time. This is different from classic networking, which allocates memory to networking services and keeps it allocated even after networking services are no longer in use.

Factors contributing to differences in memory requirements include:

- Open Transport provides implementations of networking as both 680x0 and native PowerPC

- code. PowerPC code is typically larger (but also faster).

- Open Transport provides mixed-mode applications support, making it possible for both

- PowerPC native and 680x0 applications to use native networking on PowerPC-based computers.

- Open Transport includes both the new implementations of networking and the libraries

- required to provide backward compatibility support for the older AppleTalk and MacTCP programming interfaces.

- Open Transport requires less memory on systems with virtual memory enabled. Classic

- networking has about the same memory requirements regardless of the VM setting.

- Open Transport is based on the cross-platform standard STREAMS environment, which

- requires more memory than classic networking.

The difference in memory requirements depends upon the configuration of your computer. Some examples of base memory requirements are shown in the table below.

Computer

System

Virtual
Memory

Classic
AppleTalk & MacTCP

Open
Transport

PowerPC-based

On

		350K to 450KB	200KB
PowerPC-based	Off	350K to 450KB	
			up to 1.2 MB
680x0-based	Off	350K to 450KB	
			700KB to
800KB			

Application compatibility guidelines

Apple has defined three levels of interoperability with Open Transport. The first, Open Transport Compatible, is used to describe network applications originally developed for classic AppleTalk or MacTCP programming interfaces that now take advantage of Open Transport Compatibility Services. These applications automatically gain the benefits associated with the Open Transport control panels. However, they will not realize a significant performance increase on Power Macintosh systems, nor can they take advantage of Open Transport's transport-independence capabilities.

Open Transport Ready applications have adopted the new Open Transport APIs. They are PowerPC native, in addition to running on 680x0-based Macintosh systems. Open Transport-ready applications benefit from the new control panels and may also realize a significant performance boost when running on PowerPC-based computers.

The highest category of interoperability is Open Transport Enhanced. In addition to adopting the new Open Transport APIs and being Power PC native, these applications can be dynamically configured to support AppleTalk, TCP/IP, or serial communication.

Applications that rely on undocumented APIs or examine private data structures in AppleTalk or MacTCP may not be fully compatible with Open Transport. Updated versions of these software products will be required for full compatibility.

Performance

Open Transport is designed to take advantage of the PowerPC processor. For maximum performance, however, networking applications must also take advantage of the PowerPC processor, and should adopt the new Open Transport programming interfaces.

In general, current Mac OS networking applications are written for the 680x0 processor and use the classic (680x0-based) networking programming interfaces. These applications can still be used with Open Transport, and may perform somewhat better. Networking applications that are PowerPC-native but not Open Transport-ready may yield better performance, but still fall short of the maximum potential performance because they make use of Open Transport backward compatibility rather than its full capabilities.

Performance improvements will be greater with protocols that use larger datagram sizes. For example, TCP/IP users will see greater improvements than AppleTalk users, because AppleTalk has a fixed and limited datagram size. On high-speed datalinks such as fast Ethernet, FDDI, and ATM, the performance of the network interface card (NIC) driver code is also a significant factor.

Overall performance also depends on the amount of RAM available. Larger packet sizes and higher throughput place increased demand on the buffering system of Open Transport. If Open Transport becomes low on memory, throughput decreases to accommodate the limitation.

Mac OS 8: Open Transport/PPP 1.0.1 Read Me

TOPIC

This article is the About Open Transport/PPP 1.0.1 Read Me file that comes with Mac OS 8.0.

DISCUSSION

Introduction

This document contains late-breaking information about Open Transport/PPP. For instructions about how to use Open Transport/PPP--including the modem and PPP control panels--see the Open Transport/PPP User's Manual. Onscreen help is also available in Mac OS Guide. Choose Help from the Help menu. Information about Open Transport/PPP appears in the Telecommunications topic area. Or you can click the question-mark icon that appears in the modem and PPP control panels.

Additional information about Open Transport/PPP is also available on the Open Transport/PPP home page: <http://devworld.apple.com/dev/opentransport/ppp.html>. Included on this home page is a log of the release notes that describes the changes in each beta release of the Open Transport/PPP software.

License Agreement

This release of Open Transport/PPP is subject to the terms and conditions of the license agreement that accompanies the software in the file named License. By using the software you agree to abide by the terms and conditions of the license agreement.

System Requirements

Open Transport/PPP 1.0.1 is designed to work on Mac OS-compatible computers with

a Motorola

68030- or 68040-family microprocessor, or a PowerPC 601, 603e, 604, or 604e microprocessor.

You also need Mac OS System 8.0 or later and Open Transport 1.1.2 or later.

Note: You must install Open Transport 1.1.2 or later before installing Open Transport/PPP.

Open Transport/PPP 1.0.1 requires a minimum of 500K of RAM (for 68030- or 68040-based computers) or 600K of RAM (for PowerPC-based computers). Open Transport/PPP memory requirements are based on the size of total system memory, including virtual memory, minus the size of any RAM disk or disk cache you're using.

Apple Software Update Sites

Information about updating Apple software is available online on the World Wide Web and other

online servers. On the Web, go to either of the following sites:

<http://www.info.apple.com> and

<http://www.support.apple.com>. Both of these sites provide links to the Apple Software Updates page.

These sites also provide links to the Technical Info Library (TIL). By searching for "find apple software updates" in the TIL, you can find Apple Software Updates locations for Internet, America Online, CompuServe, and other online services.

Once you reach an Apple Software Updates site, use the following path to locate the Open Transport software: Apple SW Updates/US/Macintosh/Networking-Communications/Open Transport.

Before You Install Open Transport/PPP 1.0.1

Make backup copies of the software and documents on your hard disk (especially your System Folder) before installing this software.

If you already use SLIP or PPP software to access the Internet, make a note of the configuration information that you entered into your previous SLIP or PPP control panels. Configurations are not automatically converted from third-party SLIP or PPP software.

What's New In Open Transport/PPP 1.0.1?

The OpenTpt Serial Arbitrator no longer crashes with extensions that open a serial driver during system startup (such as the Wacom Tablet driver).

Open Transport/PPP does not display dialog boxes for background-only

applications (such as
Personal Web Sharing).

Note: When opening a PPP connection from a background-only application, the machine will appear frozen until the connection is established.

Known Incompatibilities and Limitations

Open Transport 1.1.2 or later is required for use with Open Transport/PPP 1.0.1. You should not attempt to use Open Transport/PPP with a previous version of Open Transport.

ARA 2.x modem CCL scripts can be used with Open Transport/PPP. However, some ARA 2.x scripts do not support modem-based error correction and data compression, so performance may not be optimal. You should try to use one of the modem scripts provided with Open Transport/PPP. If you can't find one that matches your modem, you can modify an existing script to suit your needs.

If you are using both ARA 2.1 and Open Transport/PPP, be sure to install Open Transport/PPP after ARA 2.1 to get the correct set of modem scripts for both products.

If you are running Open Transport/PPP on a desktop Macintosh that has sleep capability, your Open Transport/PPP connection will not be automatically terminated when you choose Sleep from the Special menu, because sleeping desktop computers can continue network activity (unlike PowerBook models). If you do not want to remain connected to your PPP server when you put your desktop system to sleep, disconnect manually using the PPP control panel.

If you have a copy of Open Transport/PPP older than 1.0f1c2 installed, you must discard your old Open Transport/PPP preferences files. To do so, remove the Remote Access folder from the active Preferences folder. Restart your computer and then use the modem and PPP control panels to customize your configuration.

Open Transport/PPP 1.0.1 has some incompatibilities with the Apple Express Modem. If the internal modem choice does not appear in the modem control panel's Port pop-up menu, uncheck the "Use internal modem instead of Modem/Printer port" checkbox in the Express Modem control panel and restart. Then open the modem control panel again.

You may experience some difficulty with older application programs that do not use Open Transport and try to use the serial port while PPP is active. The workaround is to disconnect PPP using the PPP control panel before starting up the older application.

Claris EMailer version 1.1v3 or later is compatible with Open Transport 1.1.1 or later. A problem in the Quit command of earlier versions of Claris EMailer sometimes causes a crash with Open Transport 1.1.x (with or without Open Transport/PPP). For your convenience, the Claris EMailer version 1.1v3 patcher and Claris EMailer Lite version 1.1v3 patcher have been provided in the Open Transport Extras folder.

You may experience CD and TV sound problems when you are dialing your Internet service provider from a Performa 6300CD computer. The workaround is to launch Megaphone before trying to connect.

When entering phone numbers for the Motorola BitSURFR Pro 56K and 64K ISDN terminal adapters, do not use dashes or spaces between the numbers. For example, 555-9999 should be entered as 5559999. Entering spaces or dashes may prevent successful connections with the BitSURFR Pro, particularly when two ISDN channels are used.

If you use PortShare Pro from Stalker GmbH to set up a virtual modem or virtual printer port, the ports appear as modem or printer, respectively, in the modem control panel. They do not appear as virtual modem or virtual printer. PortShare Pro replaces the serial drivers for the on-board modem/printer ports with its own, so selecting modem or printer causes Open

Transport/PPP (and any other native Open Transport serial application) to use the replacement drivers.

Open Transport/PPP will report the single channel speed of 56 Kbps or 64 Kbps. The 112

Kbps or 128 Kbps speeds are used but not displayed when using a second ISDN channel

with multilink PPP. Use the terminal adapter to find out the speed of the second channel.

Compatibility with the Apple Internet Connection Kit

You can install both Open Transport/PPP and the Apple Internet Connection Kit (AICK) on your computer at the same time. Both products enable you to dial with your modem and connect to the Internet.

At the time of this release, AICK does not use the Open Transport/PPP software to dial and connect to the Internet. AICK has its own Dialer, which uses MacPPP software to establish the remote connection. MacPPP is a third-party implementation of the Point-to-Point Protocol.

All of the AICK applications, however, are compatible with Open Transport/PPP 1.0.1. To use Open Transport/PPP with AICK applications, you must configure Open Transport/PPP as described in the Open Transport/PPP User's Manual and in the Connecting to the Internet topic area of Mac OS Guide.

The currently active PPP software is selected using the Connect via pop-up menu in the TCP/IP control panel. MacPPP is listed as MacPPP. OT/PPP is listed as PPP. MacPPP is controlled by using the Config PPP control panel, the Apple Internet Dialer application, or the Apple Internet Status application. Open Transport/PPP is controlled by using the modem and PPP control panels, which do not modify or change MacPPP configuration information.

If you use both PPP software packages (one at a time), note that launching either the Apple Internet Dialer or Apple Internet Status will make MacPPP active. Furthermore, you will need to switch TCP/IP configurations each time you switch from one PPP software package to the other. (Information about changing TCP/IP configurations appears in the Network topic area of Mac OS Guide.)

Modem support

Scripts that support many popular modems are provided on the Open Transport/PPP installation

disks. The scripts include:

- 3Com Impact Analog 14.4
- 3Com Impact ISDN 56K
- 3Com Impact ISDN 56K MLPPP
- 3Com Impact ISDN 64K
- 3Com Impact ISDN 64K MLPPP
- Apple Personal Modem
- AT&T Dataport 288
- AT&T KeepInTouch
- Best Data Smart One 28.8/33.6
- Dayna CommuniCard 28800
- Farallon Netopia 56K
- Farallon Netopia 56K MLPPP
- Farallon Netopia 64K
- Farallon Netopia 64K MLPPP
- GeoPort/Express Modem
- GeoPort/Express Modem CNG
- Global Village Gold/Silver/Merc
- Global Village Platinum/Gold II
- Hayes Accura 288
- Hayes Optima 288
- Megahertz CruiseCard 14.4
- Megahertz CruiseCard 28.8
- Metricom Ricochet Wireless
- Microcom DeskPorte Fast/288
- Microcom QX/4232bis
- Motorola BitSURFR 56K
- Motorola BitSURFR 56K MLPPP
- Motorola BitSURFR 64K
- Motorola BitSURFR 64K MLPPP
- Motorola ModemSURFR 28.8
- Motorola Power/Lifestyle 28.8
- Null Modem 9600
- Null Modem 19200
- Null Modem 57600
- Null Modem 115200
- Practical Peripherals V.34
- Smart One 28.8
- Supra 14.4
- Supra 28.8/33.6
- TDK DF2814
- Telebit QBlazer
- US Robotics Universal
- Zoom V-Series

Apple now installs all modem scripts in the Modem Scripts folder (in the Extensions folder) instead

of directly in the Extensions folder. Open Transport/PPP does not recognize modem scripts stored outside the Modem Scripts folder.

Auto-routing of modem scripts has been disabled by the Installer. Once Open Transport/PPP is installed, a modem script will not be routed to the Extensions folder if it is dragged into an active System Folder.

The Easy Install mode of the Installer copies all of the Open Transport/PPP modem scripts on your disk. You can choose Custom Install to limit the installation to only the scripts you choose.

Note: You can delete any unneeded scripts from the Modem Scripts folder, which is located inside the Extensions Folder. To recognize scripts, look for files of the kind "Modem Link Tool Personal document."

Additional (Unsupported) Modem Scripts

User-contributed scripts are available online. New modems are regularly introduced and Apple is willing to help publish scripts donated by users to aid in making Apple Remote Access and Open Transport/PPP work easily with as many modems as possible.

Note: User-contributed scripts are not tested or supported by Apple Computer, Inc., so you should contact the script's author rather than Apple if you run into difficulty using a script downloaded from the unsupported folder. User-contributed modem scripts are provided on an as-is basis as a convenience to Apple customers. They are not warranted to be complete or free from errors, although Apple may choose to review and fully test some user-contributed scripts and include them in future versions of Apple software. If you want to provide Apple with feedback about particular user-contributed scripts, send electronic mail to the following address: msg@apple.com.

To find these scripts, go to any Apple Software Updates location and use the following path: Apple SW Updates/US/Macintosh/Unsupported/CCL.

If you want to contribute a modem script, please use the following procedure:

1. Download the sample Read Me file from the User-contributed scripts folder. The file is named CCL_README_TEMPLATE.

2. Customize the sample Read Me as appropriate for the script you want to submit.

3. Send electronic mail to msg@apple.com and enclose the script in BinHex format.

Scripts will only be posted if they are accompanied by a Read Me explaining the script's purpose and how to contact the author.

(See Apple Software Updates Sites near the beginning of this Read Me for information on how to find Apple Software Updates locations.)

Modem Cable Requirements

Most modems require a cable that supports the data terminal ready (DTR) signal. In addition, certain modems require a cable that supports CTS/RTS hardware flow control. To support DTR, the cable must connect pin 20 on the DB-25 connector to pin 1 on the Mini DIN-8. To support CTS/RTS, the cable must connect pin 5 on the DB-25 connector to pin 2 on the Mini DIN-8 and pin 4 on the DB-25 connector to pin 1 on the Mini DIN-8. Contact your modem vendor or Apple-authorized dealer to obtain the necessary cable.

Open Transport/PPP and Apple Remote Access Compatibility

Open Transport/PPP and ARA versions 1.0, 2.0, 2.0.1, and 2.1 are fully compatible and can be used on the same system. Only one can be used at a time.

Versions of ARA before 2.1 install modem scripts directly in the Extensions folder. To make sure that these scripts appear as choices in the modem control panel, move them to the Modem Scripts folder in the Extensions folder.

ARA 2.1 installs its scripts in the Modem Scripts folder in the Extensions folder. If you are using ARA 2.1, you must install Open Transport/PPP 1.0.1 after ARA 2.1 to get a set of scripts in the Modem Scripts folder that works optimally with both products. The Open Transport/PPP scripts support certain modem-based features, such as error correction and data compression, that improve PPP performance. The ARA 2.x scripts may not support these features.

Also, some scripts included with ARA 2.1 are no longer installed with Open Transport/PPP. These scripts are left on your disk by the Open Transport/PPP installer. They may be usable with Open Transport/PPP, but have not been tested for compatibility by Apple.

Registered User or Guest?

If your PPP server does not require a user name and password, or if the server requires only that

you enter a name and password in a terminal window, you can select the Guest mode button in the

PPP control panel. This will hide the Name and Password fields and will cause the Connect button

to be enabled as soon as you enter a phone number.

If your server requires a PPP user name and password instead of, or in addition to, a terminal server

login, you must use the Registered User mode of the PPP control panel. In this mode, you must

enter something in the Name and Number fields to enable the Connect button. If you leave the

Password field blank, and Save password is not checked, you will be prompted to confirm that you

want to connect without a password.

Connect Scripts

The following varStrings have been added to the CCL scripting language for the user name and

password:

Name: ^11 or ^U

Password: ^12 or ^P

When the connect script is executed, these varStrings are replaced by the strings stored in the

Name and Password fields of the PPP control panel.

When you record a connect script, and you have entered your name and password in the PPP

control panel, the connect script that is recorded by the terminal window will replace those strings

with the appropriate varStrings.

The ^U and ^P varStrings are provided as mnemonics for the user name and password, but they

cannot be used as parameters of some CCL commands like IFSTR. With those commands, use

the ^11 and ^12 varStrings instead.

Connection CCL scripts that use the password varString (^12) in WRITE commands do not log the

password in clear text. The password is logged as bullets. This is true whether the user records the

script or types it in.

More detailed information about the syntax of the CCL language used for both modem scripts and

connect scripts is in the ARA Modem Scripting Guide.PDF file in the OT/PPP Extras folder. This file is in Adobe Acrobat format.

Manual Dialing

Procedures for establishing an Open Transport/PPP connection with manual dialing vary according to the type of modem you are using. To ensure that you can make a connection while using manual dialing, you may need to experiment with pressing the Connect button slightly before or after you hear the remote modem answer the phone.

Using an Express Modem or GeoPort Telecom Adapter

If you are using Express Modem software with either an Express Modem or a GeoPort Telecom Adapter, you must turn on 32-bit addressing in the Memory control panel. Using 24-bit addressing may result in incorrect behavior.

Using Global Village PC Card Products

The Global Village software included with your modem adds an entry to the Connect via pop-up menu of the modem control panel called PowerPort PC Card. Under some circumstances, an entry for the actual slot your PC Card is plugged into will show up as well (Upper-slot, Lower-slot). These slot-specific items should not be used and the PowerPort PC Card item should be used instead or the port will be erroneously reported as busy.

Using an ISDN Terminal Adapter

Both Open Transport/PPP 1.0.1 and ARA 2.1 support serial connection speeds of 115,200 and 230,400 bps. By doing so, Apple enables Macintosh users to make ARA and PPP connections over ISDN lines at 64 kbps or even 112 kbps if the ISDN terminal adapters at both ends support channel bonding and proper modem scripts are used.

Note: The Connected at line of the PPP control panel status box may not accurately reflect the connection speed of ISDN connections. A slower speed may be indicated because ISDN terminal adapter hardware does not report the establishment of second channel connections to the CCL script engine. This will usually happen if you use the Multilink PPP (MLPPP) version of an ISDN script.

Connection speeds of 115,200 and 230,400 bps are not supported by the serial ports on most older Macintosh computers. Here is a partial list of Macintosh models that have fast

serial port support:

Macintosh Centris 660AV, Macintosh Quadra 660AV and Macintosh Quadra 840AV models

Macintosh Performa 6100CD series

Power Macintosh 6100, 7100, 7200, 7500, 7600, 8100, 8500, and 9500 models

Workgroup Server 6150, 7250, 8150, 8550, and 9150 models

To set the built-in serial ports at 115,200 or 230,400 bps, a new serial driver called SerialDMA must be installed to replace the standard Macintosh serial device driver. SerialDMA is provided by Apple, and the current version is 2.0.2. It is highly recommended that the file Serial (Built-in) be installed in the Extensions folder as well on Macintosh models with PCI slots to support these high speeds (38,400 bps and above). System 7.5.3 or later includes the latest version of SerialDMA and the file Serial (Built-in).

Note: In general, ISDN terminal adapters have more configuration options than conventional modems. At this time it is not possible for Apple to support all combinations of these options for all the ISDN terminal adapters that are supported. We have attempted to write scripts that work with the most common ISDN configurations. You may have to get a revised script from your Internet service provider or network administrator if your server uses different options. You can also modify a script yourself using the Modem Script Generator or by editing the script text directly.

How to Turn Off or Remove Open Transport/PPP

To disable and remove Open Transport/PPP software by using the Custom Remove option in the Installer, follow these steps:

1. Open the Installer application included with Open Transport/PPP 1.0.1. The Welcome to the Apple Installer screen appears.
2. Click the Continue button. The Open Transport PPP Installation screen appears
3. Choose Custom Remove from the pop-up menu in the upper-left corner.
4. In the list that appears, select the files you would like to remove by clicking the box next to each file so that an "X" appears in it. To completely remove Open Transport/PPP, you should select all the files listed.

5. Click the Remove button. If a window appears asking you whether to quit any open applications, click Continue. A window will appear telling you to restart your computer.

6. Click the Restart button.

7. Reinstall and configure your previous SLIP/PPP software as required.

To disable Open Transport/PPP without using the Installer, follow these steps:

Note: Although the PPP and modem control panels appear in the Extensions Manager, there is no component in the Extensions Manager that lets you disable Open Transport/PPP. To disable Open Transport/PPP without using the Installer, you must follow the instructions given here.

1. Move the OpenTpt Remote Access, OpenTpt Modem, and OpenTpt Serial Arbitrator shared libraries from the Extensions folder in the active System Folder.
2. Move the PPP Commands file from the Scripting Additions folder in the Extensions folder.
3. Move the PPP and modem control panels from the Control Panels folder in the active System Folder.
4. Restart your computer.

It is not necessary to move the Modem Scripts folder from the Extensions folder.

Mac OS 8: About AppleShare 3.6.5 Read Me

This article is the About AppleShare 3.6.5 Read Me file that comes with Mac OS 8.0.

If you have AppleShare versions 3.6, 3.6.1, 3.6.2, or 3.6.4 you should update to AppleShare 3.6.5 before installing Mac OS 8 over a network. If you have an earlier version of AppleShare, you do not need to install AppleShare 3.6.5.

Installing AppleShare 3.6.5

1. Drag the AppleShare 3.6.5 icon to your closed System Folder icon.
2. In the dialog box that appears, click OK to place AppleShare in your Extensions folder.
3. In the next dialog box that appears, click OK to replace your older version of AppleShare with the newer one.
4. Restart your computer.
5. Connect to the server you are using to install Mac OS 8.
6. Double-click the Install Mac OS icon to install the software.

Apple, the Apple logo, and AppleShare are trademarks of Apple Computer, Inc., registered in the U.S. and other countries.

Mac OS 8: About Internet Access

Subject: Mac OS 8: About Internet Access

TOPIC

This article is the About Internet Access Read Me file that comes with Mac OS 8.0.

DISCUSSION

This file contains late-breaking news about Internet Access for the Mac OS. You will find instructions on how to set up Internet Access and solutions for common problems in the manual that came with your software or computer. Additional information about the Internet and Internet Access for Mac OS 8 can be found in the Info Center.

Contents

What to do first

Troubleshooting

- Netscape is unable to locate the registration server

- Reinstalling Internet Access components

- Switching from Internet Access in Mac OS 8 to the Apple Internet

Connection Kit

- Changing your configuration type from LAN to modem, or from modem to LAN

What to do first

If you have not previously connected to the Internet with this computer, you need to configure the

Internet settings. Double-click the Internet Setup Assistant icon located in your Internet folder to

begin. If you already have an account with an Internet service provider, you should have that

information handy before you begin.

Customers in Canada

The Internet Setup Assistant can help you create automatically a new Internet account online, or set

up an existing dial-up or LAN Internet account. Double-click the Internet Setup Assistant icon located

in your Internet folder to begin. For more information on how to set up an Internet account in Canada,

refer to the Internet Extras folder on your Mac OS CD.

Customers in Asia, Australia, Latin America, and New Zealand

The Internet Setup Assistant can help you set up an existing dial-up or LAN Internet account. If you

do not yet have an Internet account, you need to set up an account with an Internet service provider

first. For more information on how to set up an Internet account in your country, refer to the Internet

Extras folder on your Mac OS CD. Then double-click the Internet Setup Assistant icon located in your

Internet folder to begin.

Additional Software

If your Mac OS software came with a CD, refer to the CD and the Internet Extras folder for late-breaking software to help you access and use the Internet more effectively.

Auto-dial and auto-disconnect settings

Your computer is set to dial your Internet service provider automatically when an application that requires an Internet connection is used. In addition, it has been set to disconnect automatically after 10 minutes of network inactivity. Use the PPP control panel to change or verify these settings.

TCP/IP connection options and Internet Access in Mac OS 8

Apple Internet Connection Kit preferences

If you used the Apple Internet Connection Kit (AICK) before you upgraded to Mac OS 8, then your Internet configurations are transferred automatically. Before you use Internet Access in Mac OS 8 it is a good idea to verify your Internet configurations. To do this, launch the Internet Setup Assistant and select Update. Then select Modify and complete the interview process.

During the interview process notice that your login and e-mail passwords are blank. This is for security reasons. You must enter the same passwords you used in AICK. If you have forgotten your passwords, contact your Internet Service Provider.

Ethernet

Internet Access for Mac OS 8 supports the Ethernet option in the TCP/IP control panel for Ethernet built into your computer. If you have added an Ethernet card to your computer, you must open the TCP/IP control panel to verify the settings are correct, and make changes if necessary.

MacIP

Internet Access for Mac OS supports MacIP configurations that use dynamic (or server-based) addressing, such as the MacIP configuration used for Apple Remote Access. It does not support MacIP configurations that use static IP addresses.

Load only when needed

The Load only when needed feature is turned on by default. We recommend that you do not change this setting. When Load only when needed is turned on, TCP/IP is not loaded until you open a network connection. If you turn this feature off, and auto-dial is turned on,

then your modem will dial every time you start up your machine. To turn this feature on or off, do the following:

1. Open the TCP/IP control panel.
2. Choose User Mode from the Edit menu.
3. Click Advanced; then click OK.
4. Click Options; then click the checkbox next to Load only when needed.
5. Click OK.
6. Close the TCP/IP control panel.

TCP/IP, PPP and modem configurations from previous versions of Mac OS
TCP/IP, PPP, and modem configurations from prior versions of Mac OS must have the same name for them to work with Internet Access in Mac OS 8. Otherwise changes you make to the TCP/IP, PPP, or modem control panels will not be reflected in Internet Access for Mac OS 8.

Follow these steps to rename PPP and modem configurations so they match your TCP/IP configurations:

1. Open the TCP/IP control panel.
2. Choose Configurations from the File menu to view your TCP/IP configurations.
3. Make a note of each configuration's name. Your list of TCP/IP configurations should be equal to the number of Internet configurations you have.
4. Click Done and then close the TCP/IP control panel.
5. Open the modem control panel.
6. Choose Configurations from the File menu to view your modem configurations.
7. Select a configuration and click Rename. Type the name that matches the corresponding TCP/IP configuration, and then click OK.
8. Repeat step 7 until all your modem configurations have been renamed.
9. Click Done and then close the modem control panel.
10. Open the PPP control panel.
11. Choose Configurations from the File menu to view your PPP configurations.

12. Select a configuration and click Rename. Type the name that matches the corresponding TCP/IP configuration, and then click OK.

13. Repeat step 11 until all your PPP configurations have been renamed

14. Click Done and close the PPP control panel.

Length of configuration names

When you use Internet Access for Mac OS you must limit the length of a configuration name to 32 characters. If you used TCP/IP or other control panels to create a configuration with a longer name, you must rename the configuration in order to use it with Internet Access for Mac OS.

To rename your configurations, follow the steps for renaming PPP and modem configurations outlined in the previous section: TCP/IP, PPP, and modem configurations from previous versions of Mac OS. Be sure to shorten the name of the TCP/IP configuration when you open the TCP/IP panel.

Modem scripts

Additional modem scripts can be found in the CD Extras folder located on the CD that came with your Mac OS software.

Password length

For security reasons, the Internet Setup Assistant displays 16 bullets in the Password boxes for e-mail and login passwords, regardless of the length of your password.

Proxies and other Internet Config settings

Internet Access for Mac OS 8 only manipulates your e-mail and news settings in Internet Config. You need to make sure other Internet Config settings, such as proxies, for each of your Internet configurations are set properly. To adjust other Internet configuration settings, double-click the Internet Config icon located in the Internet Utilities folder in your Internet folder. Then click the appropriate button, such as Firewalls, to change proxies.

Web browser issues

Using Netscape Navigator 2.0 after you've used 3.01

Mac OS 8 installs Netscape Navigator 3.01. If you use Netscape Navigator 3.01 and then want to go back to using Netscape Navigator 2.0, follow these steps to restore your preferences and bookmarks:

1. Quit Netscape Navigator if it is open.
2. Open the Backup folder in the Internet folder.
3. Drag the Netscape Preferences icon into your Netscape 2.0 folder.
4. Drag the Netscape Bookmarks.html icon into your Netscape 2.0 folder.
5. Open Netscape Navigator 2.0.

Using Netscape Navigator 3.01 with 2.0 plug-ins

When Mac OS 8 was installed, a new Netscape Navigator folder was created in the Internet

Applications folder located in the Internet folder on your startup disk. You must move your Netscape

Navigator 2.0 plug-ins to the Plug-ins folder located in this Netscape Navigator folder.

Web browser memory needs for QuickTime and Shockwave plug-ins

For optimum performance when viewing QuickTime or Shockwave media over the Internet, you

should increase the amount of memory allocated to Netscape Navigator. To do this:

1. Open the Internet folder.
2. Click the Netscape alias.
3. Choose Get Info from the File menu.
4. Click Find Original. The folder containing the Netscape icon opens, and Netscape is selected.
5. Choose Get Info from the File menu.
6. If you are using QuickTime only, increase the minimum size in the Memory Requirements box by 1000.
7. If you are using Shockwave only, increase the minimum size in the Memory Requirements box by 3000.
8. If you are using both QuickTime and Shockwave, increase the minimum size in the Memory Requirements box by 4000.

Obtaining a Web browser that uses highly secure (128-bit) encryption

Mac OS 8 installs Netscape Navigator 3.01 with International (40-bit)

encryption. This supports a

standard level of security suitable for worldwide export and use. In the United States and Canada,

some electronic commerce web sites, such as banking and shopping sites,

recommend using
non-International (128-bit) encryption for a greater level of security. Contact
Netscape
(<http://www.netscape.com>) or Microsoft (<http://www.microsoft.com>) for more
information.

Troubleshooting

You can find additional information on the problems described below in the
onscreen help on your
computer or in the documentation provided with your Mac OS software and
computer.

Netscape is unable to locate the registration server

You see this message when you try to register with an Internet service provider:

"Netscape is unable
to locate the server: reggie.netscape.com The server does not have a DNS entry.
Check the server
name in the Location (URL) and try again."

Solution: You cannot check the server name in the Location box because Netscape
runs in kiosk
mode when it connects to the registration server. Instead, you must quit
Netscape and try
connecting again. If reconnecting does not work, you may need to try registering
at a different time.

Reinstalling Internet Access components

If your Internet Access files become corrupted and you want to do a clean
installation, you must
remove all Internet Access files before you use the Installer. If you do not,
files with current version
numbers will not be replaced whether or not they are corrupted. The Internet
Access files that must
be removed are the Internet folder, the Internet Access extension, and the
following items which are
located in the Preferences folder in your System Folder: Netscape ?, Internet
Preferences, Internet
Setup Preferences, and Internet Dialer Preferences.

Switching from Internet Access in Mac OS 8 to Apple Internet Connection Kit

If you modify your old Apple Internet Connection Kit (AICK) configuration with
the Internet Setup
Assistant, the Assistant switches TCP/IP from MacPPP to PPP. If you open AICK
dialer, you see a
dialog box that asks you to go to the TCP/IP control panel. Open the TCP/IP
control panel and
choose MacPPP in the Connect Via pop-up menu.

If you decide to use AICK after Internet Access for Mac OS 8 is installed, you
can't register with a new
Internet service provider online. You must use the Internet Setup Assistant to
register with a new
ISP.

If you switch back and forth between Internet Access for Mac OS 8 and AICK, and you have multiple ISP settings with AICK, you will find duplicate configurations when you use Internet Access. Although this does not create a problem, you may want to remove the duplicate configurations. You can use the Internet Setup Utility to remove duplicate configurations. The Internet Setup Utility is located in the Internet Utilities folder located in the Internet folder on your hard disk.

Changing your configuration type from LAN to modem, or from modem to LAN
You can't use the Modify feature of the Internet Setup Assistant to change an Internet configuration type. To change an Internet configuration from LAN to modem, or from modem to LAN you must first use the Internet Setup Assistant to remove the configuration. Then you use the Internet Setup Assistant to add the configuration with the new type.

Before you remove the configuration you should write down any information that you may need, such as your login name and password.

Mac OS 8: About MRJ Read Me

TOPIC

This article is the About Mac OS Runtime for Java 1.0.2 Read Me file that comes with Mac OS 8.0.

DISCUSSION

Introduction

Mac OS Runtime for Java (MRJ) is Apple's implementation of the Java runtime environment based on software from Sun Microsystems, Inc. With MRJ, Mac OS applications can run Java applets and applications.

MRJ 1.0.2 implements version 1.0.2 of Sun's Java. MRJ 1.0.2 includes Apple Applet Runner, a standalone application that runs Java applets, and Apple Applet Viewer, an OpenDoc viewer you use to put Java applets into OpenDoc documents.

MRJ 1.0.2 is a minor upgrade to MRJ 1.0.1 that fixes a bug where some Java applications were not able to save files.

Important: The Applets menu in Apple Applet Runner includes a set of applets provided by Sun Microsystems, Inc. These applets were not created by Apple Computer, Inc. and may not follow Apple guidelines for user interaction. For example, buttons in an applet may have different behavior from buttons in applications developed specifically for the Mac OS.

System requirements

MRJ 1.0.2 works on computers with 68030 or 68040 microprocessors or PowerPC microprocessors. You also need System 7.5 or later, a minimum of 8 MB of RAM (16 MB is strongly

recommended) and at least 7 MB of free disk space. Computers with 68030 or 68040 microprocessors must have 32-bit addressing turned on. This can be done by using the Memory control panel.

The Apple Applet Viewer requires OpenDoc 1.0.4 or later. To get OpenDoc, see the OpenDoc Web page at <http://www.opendoc.apple.com/>. MRJ 1.0.2 and the Apple Applet Runner do not require OpenDoc.

Using Java applets over the Internet requires MacTCP 2.0.4 or later, or OpenTransport 1.1 or later with TCP/IP, and an active Internet connection.

MRJ 1.0.2 works with Cyberdog 1.2.1 or later. See the Cyberdog Web page at <http://www.cyberdog.apple.com/> for more information.

What Is Installed with MRJ?

The MRJ 1.0.2 installer places the required software components in your System Folder. If necessary, the installer will force you to restart your computer before using MRJ.

Warning: If you have been using a pre-release version of MRJ, you need to remove files installed with the pre-release version before installing version 1.0.2. Use the list below to check the files you need to remove. However, do not remove the file named Text Encoding Converter or the folder named Text Encodings.

On all computers, MRJ 1.0.2 installs:

- Mac OS Runtime for Java folder in the Apple Extras folder at the root of the startup disk
- MRJ Libraries folder in the Extensions folder of the active System Folder
- Text Encoding Converter in the Extensions folder of the active System Folder
- Text Encodings folder in the active System Folder

If you have a 68030 or 68040 computer, MRJ 1.0.2 also installs CFM-68K Runtime Enabler in the Extensions folder of the active System Folder

If you have OpenDoc installed, MRJ 1.0.2 also installs:

- Apple Applet Viewer Libraries in the Editors folder of the active System Folder
- Apple Applet Viewer Stationery in the Stationery folder at the root of the startup disk

Using the Apple Applet Runner produces a preferences file named Apple Applet Runner Prefs in the Preferences folder of the active System Folder.

Description of MRJ Components

MRJ 1.0.2 contains the system components necessary to use Java. It also includes two demonstration tools that use these components to run Java applets.

System Components

The MRJ 1.0.2 installer puts a folder named MRJ Libraries in the Extensions folder of the active System Folder. This folder contains two items necessary for Java support: MRJLib and the MRJClasses folder.

Apple Applet Runner

You use Apple Applet Runner to run Java applets from your local disk. If you have MacTCP or Open Transport installed and an active Internet connection, you can also run Java applets over the Internet.

You can open URLs or local HTML files containing <applet> tags from the Applet Runner's File menu. In addition, you can drop HTML files containing <applet> tags onto the Apple Applet Runner application icon from the Finder. You will only see the applet itself inside Apple Applet Runner; if you use a Web browser to open the HTML file, you may see additional information.

Apple Applet Runner remembers URLs of remote (http://) or local (file:///) applets. This information is stored in the Apple Applet Runner Prefs file in the Preferences folder of the active System Folder. A few sample URLs are available by choosing Open URL from the File menu; you may add more URLs if you desire. You must have an active Internet connection to use these remote URLs.

Demonstration applets are available under the Applets menu in Applet Runner. You may run these demonstration applets even if you do not have an active Internet connection. These applets are stored locally in the Applets folder.

Apple Applet Viewer (for OpenDoc)

You use Apple Applet Viewer to place Java applets into your OpenDoc documents.

A folder called Apple Applet Viewer is installed in your Editors folder and the Apple Applet Viewer Stationery file is installed in your Stationery folder. Refer to your OpenDoc

documentation for
instructions on using stationery.

You use Java applets by dragging one of the following to the Apple Applet Viewer frame:

- An HTML file that contains an <applet> tag,
- A text file that contains a URL for an HTML document containing an <applet> tag, or
- A Scrapbook clipping that contains either a URL for an HTML document containing an <applet> tag or an <applet> tag.

Note: You must have an active Internet connection to use applets at remote URLs.

Tips for Using MRJ

OpenDoc

If you do not have OpenDoc installed when you install MRJ 1.0.2, the Apple Applet Viewer will not be installed. If you install OpenDoc later, you must reinstall MRJ to use the Applet Viewer.

Memory Usage

MRJ uses system memory to run Java applets and applications. Applications allocate their own application memory, leaving less memory available to the system. If an application that uses MRJ (such as the Applet Runner or Cyberdog) is using an especially large amount of memory, you may have trouble running large Java applets or applications. If you encounter problems, try quitting applications you are not using. If you still cannot run the applet or application, try reducing the amount of memory used by the application that is using MRJ.

To reduce an application's memory size, first quit the application, then select the application's icon and choose Get Info from the File menu. Type a smaller number in the Preferred Size field. (However, do not set the preferred size smaller than the indicated minimum size.)

Known Problems

You must restart your computer after installing MRJ. If you attempt to run MRJ without restarting, MRJ may behave in unexpected ways.

Do not remove the Text Encodings folder from the System Folder or the Text Encoder Converter file from the Extensions folder. Removing these items may cause problems while using

MRJ or using
other applications requiring these files.

In pre-release versions of MRJ, the preferences file was named Applet Runner Prefs. If you had a pre-release version of MRJ installed, make sure you throw the Applet Runner Prefs file away. (The old file may conflict with preference files created by applet runner applications from other companies.)

There is a known problem with the PPCExceptionEnabler extension. This extension is installed by Macintosh Common Lisp (MCL) 3.9. If you have this extension, you must remove it before running MRJ. Future versions of MCL will not require this extension.

There are known problems with some applets when using MRJ 1.0.2 with Microsoft Internet Explorer, including display problems, sound problems and possible crashes. We are working with Microsoft to resolve these problems in a future release of Internet Explorer.

If you are running applications or applets compiled with the JavaSoft 1.0.2 JDK release for Macintosh, you may encounter numerics-related problems. Specifically, floating-point constants (and in some cases computed integer constants) may not be accurate. If possible, use another Java compiler to recompile any applications or applets displaying this problem.

If all the images and sounds an applet uses do not appear, there may not be enough memory available for all the images and sounds. You may be able to free up memory by quitting all applications (such as the Apple Applet Runner and Apple Applet Viewer) that use MRJ. If necessary, try quitting other applications as well. After quitting the applications, try reopening Apple Applet Runner or Apple Applet Viewer. See Memory Usage above for additional information.

Some Java applets (such as Clock) or applications that are processor intensive may cause other applets to open or run slowly, or may cause them not to open at all. To improve performance, try closing applets or applications that you are not using.

The Apple Applet Viewer does not report some errors. If an applet does not open in Apple Applet Viewer, try opening it with Apple Applet Runner to see if an error message appears.

Further Information and Reporting Problems

See our Web site at <http://applejava.apple.com/> to find out about future releases of Mac OS Runtime for Java or get information on how to report problems with the software.

Other Applets on the Internet

There are thousands of applets available on the Internet. Two good starting points for finding applets are <http://www.javasoft.com/> and <http://www.gamelan.com/>.

Software Development Kit Available

A software development kit (SDK) is available for MRJ 1.0.2. The MRJ SDK includes interfaces to the runtime environment that allow software developers to:

- run Java applets and applications within a Macintosh application
- access the Java runtime from a Macintosh application
- call Java methods from C and C++
- call native methods from Java
- build standalone Java applications

The SDK also includes a utility to run Java applications.

See our Web site at <http://applejava.apple.com/> to get the MRJ SDK.

Java not fault-tolerant

The Java technology is not fault-tolerant and is not designed, manufactured or intended for use or resale as on-line control equipment in the operation of nuclear facilities, aircraft navigation or communication systems, or air traffic control machines in which the failure of the Java technology or Mac OS Runtime for Java could lead directly to death, personal injury, or severe physical or environmental damage.

Mac OS 8: About OpenDoc Read Me

TOPIC

This article is the About OpenDoc Read Me file that comes with Mac OS 8.0.

DISCUSSION

What is OpenDoc?

OpenDoc is a new plug-in software architecture that lets you extend the usefulness of your applications by easily adding new functionality. OpenDoc uses software components (called parts) that can be dragged-and-dropped into documents created by any OpenDoc-aware application. You can combine parts from different Mac OS software developers to add tables, graphs, outlines, and even live Internet resources into your documents. Since OpenDoc is a cross-platform technology, documents created with OpenDoc can work across different computer platforms, including Mac OS, Windows, UNIX, and OS/2.

What does OpenDoc install?

Installing OpenDoc adds the following items to your computer:

- OpenDoc system software (in the Extensions folder)
- the Editors folder (in the System Folder)
- the Stationery folder (at the root level of your hard disk)

OpenDoc system software

After you install OpenDoc system software, your computer is ready to use OpenDoc parts and

OpenDoc-aware applications from popular Mac OS software developers.

The Editors folder

When you install OpenDoc parts, the part editors are placed in the Editors folder. Editors are like mini-applications that handle different types of data, such as text, graphics, or Internet information.

Once an editor is installed, it works something like a system extension: its functionality is available

but you do not open or use the editor itself. To use an editor, you need to locate the editor's stationery (in the Stationery folder on the root level of your hard drive).

Important: All of your OpenDoc editors should be located in the Editors folder (inside the System Folder). Otherwise, OpenDoc will not be able to locate the editors.

The Stationery folder

When you install an OpenDoc part, part stationery is placed in the Stationery folder. You can either double-click an editor's stationery to create a new document with the editor or drag the stationery into another document to add the editor's functionality to any OpenDoc-aware application or document. OpenDoc stationery can be placed anywhere in your system. You do not have to leave it in the Stationery folder.

Where can I get more information?

For more information about OpenDoc and developers who are producing OpenDoc-aware software, look on the World Wide Web at <http://opendoc.apple.com>.

Apple, the Apple logo, AppleShare, Mac, and OpenDoc are trademarks of Apple Computer, Inc., registered in the U.S. and other countries. UNIX is a registered trademark of Novell, Inc. in the U.S. and other countries, licensed exclusively through X/Open Company, Ltd.

Mac OS 8: About Personal Web Sharing Read Me

TOPIC

This article is the About Personal Web Sharing Read Me file that comes with Mac OS 8.0.

DISCUSSION

Important information about Mac OS Personal Web Sharing

Welcome to Mac OS Personal Web Sharing. This read me document introduces the software and

contains late-breaking information about setting up and using your own Web server.

Mac OS Personal Web Sharing is the easiest way to share your information with everyone on your intranet, no matter what type of computer or browser they are using. All you do is put the items you want to share in the server folder and turn on the server.

Installing Personal Web Sharing

To install Personal Web Sharing, double-click the WebScript icon in the Web Sharing folder. To set

up your Web server, see the instructions in Using Personal Web Sharing in the Web Pages folder

(which is created when the software is installed) at the root level of your hard disk.

The Web Pages folder also contains a file named Default.html which you can use as the home

page for your server. You can modify this file or choose a different home page (see Using Personal Web Sharing for instructions).

Compatibility

Personal Web Sharing is compatible with Open Transport 1.1.1 (or a more recent version). MacTCP

2.0.6 is supported only with System 7.5.5, but we have noticed some inconsistencies with large volume connections.

Important: A continuous TCP/IP connection and a static IP address are strongly recommended for use of Personal Web Sharing. If your system does not have a persistent

connection and a static IP address, any interruption in the network connection could negatively affect TCP/IP signals. In some circumstances, this could cause the system to appear to hang. To avoid this problem, always use a continuous TCP/IP connection and a static IP address.

Note: This problem could also occur with other server applications.

Known Problems

Virtual memory off

Web servers expose a bug in the Ethernet driver for PCI-based computers. To ensure that your server works correctly, either turn off virtual memory (VM) or install Mac OS System 7.6.

OT/PPP

There is a known problem using OT/PPP 1.0 with Personal Web Sharing. This software runs as a background application, which conflicts with the dialog box that PPP tries to display when reconnecting (if the connection has been broken). This can cause your system to crash. To work around this problem, turn off the automatic reconnect option in the PPP control panel.

Follow these steps to turn off the automatic reconnect option:

1. Open the PPP control panel.
2. Click the Options button.
3. Click the Connection tab.
4. Click to remove the X from the box labeled Connect automatically when starting TCP/IP applications, and click OK.
5. Close the PPP control panel.

Location of server folder

To ensure that the correct content is served, the Web Pages folder (or other server folder) should be located no more than five levels below the root level of the hard disk.

Browsers look for index.html document

Visitors to your Web server may use a browser that automatically looks for a document named default.html or one named index.html as the point of entry (home page) to your server, regardless of the home page you select in the Web Sharing control panel. This occurs because some browsers

assume that the home page will have one of the names noted above, and they only look for the home page name you specified after looking for either default.html or index.html.

You can avoid having visitors inadvertently see the wrong document by renaming any files named default.html and index.html (whether at root level or inside a nested folder on the server). If you change document names, be sure to revise any links to the renamed documents so they reflect the new name.

Personal NetFinder and an index.html document

In Personal NetFinder view (similar to list view in the Finder), if there is a document named index.html, it will open in the visitor's browser. Therefore visitors will see that document as if it were a home page, and the list view of files at that level of the server will not be displayed. If you do not want visitors to see the list of files in a certain folder on your server, you can put an index.html document in that folder. By contrast, if you want visitors always to see a list of files at each level of the server's content, do not include any files named index.html.

File sharing and AppleShare

If you want to use access privileges for your server, you must use the File Sharing privileges, which you set in the Users & Groups control panel of your system software. Personal Web Sharing is incompatible with the Users & Groups component of the AppleShare Server Software; do not use AppleShare Server Software's privileges for your Web server. If you want to use the AppleShare Server Software and Personal Web Sharing, configure the Web server to give everyone read-only access in the Web Sharing control panel.

MacIP via LocalTalk

Some computers providing a server may experience slower performance overall during times of heavy activity on the Personal Web Sharing server over LocalTalk.

IP Addressing

Every Personal Web Sharing server will need a unique assigned IP address. Do not use nonstandard IP addressing with your server. Some IP addresses (0.0.0.0 or 1.1.1.1, for example) are reserved for network hardware such as routers and gateways. If you are not sure how to assign an IP address to your server, contact your network administrator.

Optimizing Personal NetFinder

As with the Finder, Personal NetFinder will take a longer time to display its list of files if the server contains a large number of files. To optimize performance, limit the number of items in any one folder in your server content.

CGIs (Common Gateway Interfaces)

CGIs are applications, created by developers, that add functionality such as counters, image maps, and database access to your server. Personal Web Sharing supports CGIs that are compatible with MacHTTP 2.2 and WebStar 1.3.1. To obtain information about CGIs, contact your Internet Service Provider, a user group, or your network administrator.

Mixed-Platform Environment

Personal Web Sharing allows you to publish documents across multiple platforms. Because character sets may differ from one platform to another, you may notice a difference in how data is displayed on some other types of computers on the network. To get a more accurate representation of HTML documents in a cross-platform environment, we recommend that you use Personal NetFinder to display the documents on your server.

File formats also vary from one type of computer to another in a cross-platform environment. Each computer on the network should have its browser's helper applications configured correctly for the types of files your server contains before connecting to your server.

Non-English-Language Documents

Mac to Mac: If your server contains non-English-language pages, the client's browser should be set to the appropriate document encoding option. Please review your browser documentation for more information on document encoding.

Mac to non-Mac: If your server contains non-English-language pages, a non-Mac OS computer will encounter some incompatibilities. For example, character sets may differ from one type of computer to another.

Non-English System Software

Personal NetFinder displays header information in the language of the Finder (part of the system software) used by the server.

Mac and the Mac OS logo are trademarks of Apple Computer, Inc. used under license.

Mac OS 8: About QuickDraw GX Read Me

TOPIC

This article is the About QuickDraw GX Read Me file that comes with Mac OS 8.0.

DISCUSSION

Visit the QuickDraw GX website (start at <http://www.macos.apple.com/macos/tech.html>) for the latest information about applications, utilities, and fonts which enhance your productivity using QuickDraw GX 1.1.6.

Prompted by our new dual OS strategy--Mac OS and Rhapsody--Apple has reevaluated the graphics and printing architectures of Mac OS. This Read Me outlines the decisions that have been made to provide a better printing migration path for our customers to future OS releases. The new implementation of QuickDraw GX will continue to offer our customers the advantages of the superior graphic and typography features of the Mac OS, while still providing an attractive printing environment.

Mac OS Unified Printing Architecture; GX Printer Drivers and GX Printing Extensions No Longer Supported
Beginning with Mac OS 8 and QuickDraw GX 1.1.6, Apple will provide a unified operating system printing architecture, standardizing on classic (non-GX) QuickDraw printing and printer drivers. With the unified printing architecture, QuickDraw GX printer drivers and QuickDraw GX printing extensions will not be supported in Mac OS 8 and future Mac OS releases.

Other than simplifying the printing procedure, the impact of Apple's new unified printing architecture

will be fairly minimal. For applications that work in both QuickDraw GX and classic QuickDraw printing environments, no changes in operation will be necessary.

Customers wanting to print from their QuickDraw GX-only application will have to obtain a version of the application upgraded to be able to print via non-QuickDraw GX printing. Please contact your application's vendor for information on availability.

Using Fonts with QuickDraw GX 1.1.6

QuickDraw GX no longer enables Type 1 Fonts Automatically

If you would like to use Type 1 fonts with QuickDraw GX installed, you can use the Type 1 Enabler (one of the QuickDraw GX Utilities available via Custom Install). The Type 1 Enabler allows you to create copies of your Type 1 fonts that are compatible with QuickDraw GX. Your original Type 1 fonts are not modified and are placed in a folder called Archived Type 1 Fonts.

Using the Type 1 Enabler

To install the QuickDraw GX Utilities and enable Type 1 fonts, perform a custom install of QuickDraw GX 1.1.6; see the instructions in Chapter 3 (Adding and Removing Software) of the Mac OS 8 Installation Guide.

When using the Type 1 Enabler, make sure that each Type 1 font family is in its own suitcase. The Type 1 Enabler will not enable your Type 1 fonts if multiple font families are contained in one suitcase.

The Type 1 Enabler supports only Type 1 fonts. If the Type 1 Enabler program encounters a suitcase containing Type 3 fonts, it displays the message "Contains a Type 3 font program" and does not enable the suitcase.

The Type 1 Enabler does not enable hybrid fonts. If you see the message "Contains a hybrid font program (see README file for details)" when the Type 1 Enabler attempts to enable Optima or ITC Eras, it may be because you have an old version of these fonts. These fonts cannot be enabled because they are hybrid fonts. If you are a registered owner of Optima or ITC Eras, call Adobe Systems Technical Support to obtain an upgrade to the non-hybrid versions of these families.

The Type 1 Enabler may not succeed in restarting your system after it is finished. If this happens,

you should restart your system manually from the Finder.

Removing Duplicate Fonts

To make sure that QuickDraw GX properly manages currently installed fonts, you should make sure you have no duplicate fonts installed in the System Folder. Remove any duplicates that you find.

Restoring Type 1 Fonts to Their Original State

If you remove QuickDraw GX from your system, you need to restore your Type 1 fonts. To restore Type 1 fonts, follow these steps:

1. Open the System Folder.
2. Open the Fonts folder.
3. Drag any suitcases that have been enabled to the Trash.
4. Open the Archived Type 1 Fonts folder.
5. Move the contents of the Archived Type 1 Fonts folder to the Fonts folder.
6. Drag the Archived Type 1 Fonts folder to the Trash.

Adobe Type Manager version 4.0.2

ATM version 4.0.2 can be custom installed with this version of QuickDraw GX.

Caution: installing ATM 4.0.2 will replace any other installed version of ATM, including ATM Deluxe.

Type 1 fonts will display and print properly only if ATM is installed and turned on. As with previous versions, ATM 4.0.2 rasterizes Type 1 font data from the POST resource in conventional outline font files (file type LWFN). In addition, ATM 4.0.2 rasterizes Type 1 font data from the sfnt resource in suitcase files (file type FFIL). ATM 4.0.2 does not include font substitution capability.

Previous versions of ATM and ATM Deluxe 4.0 are not compatible with this version of QuickDraw GX.

Type 1 fonts will display on the screen but will not print. Check with Adobe for a newer version of ATM Deluxe.

Portable Digital Documents

You will no longer be able to create GX PDDs with QuickDraw GX 1.1.6. Also, SimpleText will not display PDDs under QuickDraw GX 1.1.6. You should convert PDD files to a different format, such as Adobe Acrobat PDF files, before attempting to use them with Mac OS 8 or QuickDraw GX 1.1.6.

Adobe Acrobat

If you install Adobe Acrobat prior to installing QuickDraw GX, you will need to reinstall Acrobat afterwards. Acrobat needs to recognize that QuickDraw GX is present when it is installed in order to function properly.

QuickDraw GX and WorldScript II

Make sure that you upgrade to the newest version of WorldScript II, included with Mac OS 8. You will need to do a custom install from the Mac OS Installer.

QuickDraw GX and At Ease

Make sure that you are using At Ease version 2.0.3 or later.

Printer Driver Versions

Apple recommends that you use the latest versions of drivers for Apple printers, installed as part of Mac OS 8, when printing from QuickDraw GX applications. The printer drivers included with Mac OS 8 are all compatible with QuickDraw GX.

Application Compatibility

Apple has conducted some limited compatibility testing with QuickDraw GX 1.1.6 and GX-aware applications. If you do not see your application listed here, contact the application vendor for compatibility information.

The following GX-aware applications are fully functional with QuickDraw GX 1.1.6 installed:

- BareBones BBEdit 4.0.4
- Cherwell pro fit 5.00
- ClaireWare Personal Log 2.10
- Microsoft Word 6.01
- Microsoft Excel 5.00
- NisusWriter 5.00
- PierceSoft ShareDraw 2.01
- Symantec Act! 2.50
- WorldSoft WorldWrite 3.0.1

The following applications will not start up if QuickDraw GX 1.1.6 is installed:

- Lightning Draw GX
- MovieClips
- TexGX 1.1b3

The following applications will not print correctly if QuickDraw GX 1.1.6 is installed:

Nisus Qued/M 3.00
PaceWorks ObjectDancer 1.00
Pixar Typestry 2.1.1
UniQorn
Corel WordPerfect 3.5.2 (68k only)

Contact the application vendor for information on obtaining updated versions of these applications.

Known Problems

Current versions of printer drivers may generate large spool files and take a long time to print when printing documents containing QuickDraw GX data. In addition, QuickDraw GX data printed to the Apple Color LaserWriter may be printed at less than full printer resolution. These problems will be addressed in future versions of printer drivers from Apple and other vendors.

With ATM 4.0.2, some PDF documents that use ATM substitution fonts may not print correctly using the LaserWriter 8 driver. This problem will be fixed in a future version of LaserWriter 8 and/or ATM.

Some older QuickDraw pictures with embedded QuickDraw GX data may print with random noise in the background of the picture. This is due to a problem in QuickTime, and will be fixed in a future version of QuickTime.

Some QuickDraw GX data may print incorrectly in low memory conditions. You may notice that parts of the image repeat rather than the entire image printing correctly. This problem is in the QuickDraw GX QuickTime Codec and will be fixed in a future version of QuickTime. Apple will also make an interim fix available on its web site via a new version of the QuickTime GX Codec. Check <http://support.info.apple.com/ftp/swhome.html> for availability.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Mac OS 8: About 5XXX/6XXX Tester Read Me

TOPIC

This article is the About the 5XXX/6XXX Tester Read Me file that comes with Mac OS 8.0.

DISCUSSION

This document describes the 5XXX/6XXX Tester application. This application checks Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers for hardware problems that may cause the computer to freeze. The tester only works on Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers.

IMPORTANT: The Power Macintosh or Performa 6360 does not have this hardware problem. If you have a Power Macintosh or Performa 6360, you do not need to use the tester program.

If you are experiencing problems with your computer other than system freezing, you should contact an Apple-authorized service provider to obtain a full diagnostic test.

How to use the tester application
To use the tester application, double-click its icon.

After the tester has checked your computer, you will see a message. If the message indicates that a problem has been found, contact an Apple-authorized service provider or Apple customer support to have your computer repaired. The necessary repairs are covered under a repair extension program.

Apple, the Apple logo, Performa, and Power Macintosh are trademarks of Apple Computer, Inc., registered in the U.S. and other countries.

Mac OS 8: About the Utilities Read Me

TOPIC

This article is the About the Utilities Read Me file that comes with Mac OS 8.0.

DISCUSSION

This document contains information about the utilities provided with Mac OS 8.

5xxx/6xxx Tester

This program tests Performa and Power Macintosh 5200, 5300, 6200, and 6300 computers for a possible hardware problem. If you have a Performa or Power Macintosh 5200, 5300, 6200, or 6300 series computer, you should use the tester before installing Mac OS 8. See the document inside the Tester folder for instructions on using the tester.

Important: The Power Macintosh or Performa 6320, 6360, and 5260 do not have this hardware problem. If you have a Power Macintosh or Performa 6320, 6360, or 5260, you do not need to use the tester program.

AppleShare software

If you have AppleShare software earlier than version 3.6.5, you should upgrade to version 3.6.5 before installing Mac OS 8 over a network. See the document inside the AppleShare folder for instructions.

Drive Setup

You use the Drive Setup program to update your disk driver or to reinitialize a disk. When you do this, all the contents of your hard disk are erased.

To update the disk driver with Drive Setup, follow these steps:

Warning: Before using Drive Setup to update your disk driver, make sure you turn off any disk protection software you may be using.

1. Open the Drive Setup program.
2. Click the disk whose driver you want to update.
3. Choose Update Driver from the Functions menu.

Important: If the Update Driver command is dimmed, or if the disk name never appears when you click Drive, the problem disk is either not supported, or it is previously has been updated with a non-Apple utility.

After installing Mac OS 8, you cannot use the obsolete Apple HD SC Setup utility to initialize your hard disk. Use the Drive Setup program supplied with Mac OS 8 instead.

Disk not supported

If the disk is not supported, check the instructions that came with your computer or disk to see if the manufacturer includes or recommends a disk utility, and use that utility to update the driver. To ensure a successful update, obtain the latest version of the utility. If you have an Iomega Zip or Jaz drive, updated driver software is provided on the Mac OS 8 CD, in the CD Extras folder.

Disk updated with non-Apple utility

If you have updated or formatted the disk with a non-Apple utility, you will need to use that utility again to perform the update. To ensure a successful update, obtain the latest version of the utility.

Disk First Aid

You use the Disk First Aid program to diagnose and repair problems with your hard disk. In order to successfully repair problems, you must start up your computer using a disk other than the hard disk being repaired. You can use the Mac OS 8 CD or disks for this. See the installation manual for details.

Disk Copy

You use the Disk Copy program to make exact copies of floppy disks from a disk image, mount disk images on your desktop, and various other functions related to disk images. Many Apple updates are provided in Disk Copy format. You can use this program to create floppy disks or otherwise use the disk images. See the information in the Disk Copy folder for details.

SimpleText

SimpleText is a text editing program that you can use to create, edit, and view

documents. It can also
play QuickTime movies, display QuickDraw 3D objects, and speak text aloud. Many
Read Me files,
such as this one, are distributed in SimpleText format.

Apple, the Apple logo, AppleShare, Mac OS, Macintosh, Performa, Power Macintosh,
and QuickTime
are trademarks of Apple Computer, Inc., registered in the U.S. and other
countries. Disk First Aid
and QuickDraw are trademarks of Apple Computer, Inc.

Mac OS 8: Apple Location Manager Read Me

TOPIC

This article is the Apple Location Manager Read Me file that comes with Mac OS 8.0.

DISCUSSION

This document provides late-breaking news about the Apple Location Manager control panel. You may want to print this document to keep with the user's manual for your computer.

Additional modules for Apple Location Manager
Additional modules for Apple Location Manager are being developed. Check the Web address <http://www.powerbook.apple.com> regularly for more information.

Quick start for Apple Location Manager
To assure that Apple Location Manager recognizes all the modules you can add to locations, follow these steps the first time you use the Location Manager control panel.

1. Before you open the Location Manager control panel, open and close the Extensions Manager control panel.
2. Open both AppleTalk and TCP/IP control panels and create a new configuration in each control panel. (Save the configuration with a name other than Default.) For instructions, see "How do I change AppleTalk settings all at once?" in the Networks section of Mac OS Guide.
3. Open the Location Manager control panel and create the locations you want to use.

Name to avoid when naming a location
To avoid confusion, do not use the name "None (off)" for a location you create with Apple Location Manager. This is the phrase you use to turn off Location Manager or to select

none of the existing
locations in the control panel's pop-up menu.

Setting a startup location

Apple Location Manager only changes system settings when you tell it to; it does not automatically change settings at startup (although you can use Preferences in the Edit menu to have the program prompt you to change settings). If you want Apple Location Manager to switch to a specific location each time the computer starts up, you can create an AppleScript script that performs that task. Put the script in the Startup Items folder and the location you want will be set at startup. Open the location you want to use at startup, then create the script below. Using the Script Editor application, type the following lines:

```
tell application "Finder"

open file ((control panels folder as string) & "Location Manager")

tell application "Location Manager"

set current location to location "snd"

end tell

end tell
```

Copy the script above exactly and substitute the name of your location for "snd;" for instance, type Sample if you want the Sample location to be used each time you start up. When finished typing the script, launch Location Manager and then compile the script.

Using Auto-Open Item to open folders or mount servers

You can set Apple Location Manager to open one or more items automatically when a location becomes active. These items can be documents or programs. To open a folder or mount a server, you must first create an alias to the item, then choose that alias when adding Auto-Open Item to a location. (You create an alias by selecting the item and choosing Make Alias from the File menu.)

Deferred switches when switching at startup

If you switch locations as the computer is starting up, Apple Location Manager may defer changing some settings such as sound level or auto-opening a document, until the computer's startup procedure is complete. Usually you will see a message reporting that the switch to the new settings

is being deferred.

If you switch locations during startup and then switch again before continuing with the startup process, the deferred settings will only occur for the last location chosen. If there were deferred settings in the first location, they will be skipped.

Installing Apple Location Manager

Always use the installer program to install Apple Location Manager. The software may not work correctly if you try to copy or drag it to the System Folder. (You install Apple Location Manager by locating its folder in the Install Applications folder on the CD that came with your computer and double-clicking the install document.)

Using existing locations on a different computer

You can export and import locations you create with Apple Location Manager. To use a location on a different computer, follow these steps:

1. Export the location you want to use on the other computer. (To export a location, select it in the Location Manager control panel, choose Export Location... in the File menu, and specify where to save the exported location.)
2. Install Apple Location Manager on the other computer, using the installer program.
3. Open Apple Location Manager and import the location you exported previously. (You import a location by choosing Import Location... from the File menu and selecting the location file you want to use.)

Importing may not install all software

Importing a location from another computer does not guarantee that all the software required to use the location is installed. (Apple Location Manager does not install software.) For example, you may import a location that specifies LaserWriter 300 as the default printer, but the location cannot switch to that printer unless you have the printer's driver software installed. Therefore, it is a good idea to check all the settings in a location you import to verify that they are available on the new computer.

Selecting and setting up a LaserWriter

If you import any location that includes settings for a LaserWriter as the default printer, you must reselect and set up the printer in the Chooser. (Otherwise the location you

imported will use the generic printer information for your LaserWriter instead of the specific information for the model identified in the original location.) You select and set up a LaserWriter by:

1. opening the Chooser
2. selecting the LaserWriter icon
3. selecting the printer's name
4. clicking the Setup button
5. clicking Auto Setup. When the printer's model name appears, click OK.

Note: your computer must be connected to the network the printer is on to update the LaserWriter correctly.

Incompatibility with At Ease's Protect System Folder option

If you are using At Ease on your computer and you establish locations for Apple Location Manager, you may see an error message when a module for Location Manager interacts with part of the system software to which access has been restricted by At Ease. You may need to turn off the Protect System Folder option so that Location Manager operates correctly.

Apple, the Apple logo, Mac, Macintosh, and PowerBook are trademarks of Apple Computer, Inc., registered in the U.S. and other countries. AppleScript and At Ease are trademarks of Apple Computer, Inc. All other product names are trademarks or registered trademarks of their respective holders. Mention of non-Apple products is for informational purposes and constitutes neither an endorsement nor a recommendation. Apple assumes no responsibility with regard to the selection, performance, or use of these products.

Mac OS 8: Installing Mac OS 8

TOPIC

This article is the Installing Mac OS 8 Read Me file.

DISCUSSION

This document describes how to install Mac OS 8. It includes compatibility information, instructions for the Install Mac OS application program, and basic installation troubleshooting. For more detailed information, see the Mac OS 8 installation manual.

Warning: PowerTalk is not compatible with Mac OS 8. After you install Mac OS 8, you will not be able to access your PowerTalk mail or catalogs, nor will you be able to use your keychain or other PowerTalk services. See the Mac OS 8 installation manual for more information.

Warning: Application programs that use QuickDraw GX may not be able to print due to changes in the version of QuickDraw GX included with Mac OS 8. See the file About QuickDraw GX for more information.

Before you install

1. Turn off any security software that you may have installed on your computer.
2. If you have a PowerBook, make sure that it is plugged into AC power and set not to go to sleep.
3. If you have AppleShare software earlier than version 3.6.4, you should upgrade to version 3.6.4 before installing Mac OS 8 over a network. See the document in the AppleShare folder in the Utilities folder for instructions.
4. Write down your current Internet settings, such as the IP address, subnet mask, name server, and so on. After installation, the Internet Setup Assistant will ask you to enter this information.
5. Start up your computer using the Mac OS CD-ROM disc or the Mac OS 8 Install Me

..TIL28034-Mac_OS_8-Installing_Mac_OS_8.pdf

First floppy disk. See your installation manual for instructions.

If you can't start up with the Mac OS 8 disks, be sure to do the following additional steps:

1. Turn off any virus-protection software that you may have installed on your computer.
2. Disable all non-Apple extensions and control panels. If you have System 7.5 or later, use the Extensions Manager control panel to select the System 7.x base set of extensions and control panels. See the installation manual for more details.
3. Restart your computer before installing Mac OS 8.

Compatibility information

Although compatibility problems are not expected, you can ensure a smooth upgrade by checking with the manufacturers of any non-Apple software you use to make sure it is compatible with Mac OS 8. If you do experience a problem, see the troubleshooting chapter in your installation manual for more information on isolating compatibility problems.

Computers with 68040 processor upgrade cards

Computers upgraded to 68040 with a processor upgrade card are not supported by Mac OS 8.

Performa or Power Macintosh 5000 and 6000 series computers

Some Performa or Power Macintosh 5200 series, 5300 series, 6200 series, and 6300 series models cannot use Mac OS 8 until a hardware problem is fixed. The repairs are covered under the Apple repair extension program. To see if your computer has this hardware problem, use the 5xxx/6xxx Tester utility in the Utilities folder on the CD before installing Mac OS 8.

Note: The Power Macintosh or Performa 6320, 6360, and 5260 do not have this hardware problem. If you have a Power Macintosh or Performa 6320, 6360, or 5260, you do not need to use the tester program.

Installing Mac OS 8

Accelerated NuBus PowerPC computers

If you have a Power Macintosh 6100, 7100, 8100, or 9150 with a third-party accelerator that increases the clock speed of your computer, the Installer might refuse to install Mac OS 8 because it doesn't recognize your system. You can install

Mac OS 8 on these computers by using the individual installers located in the Software Installers folder on the Mac OS 8 CD instead.

MacODBC and Mac OS 8

If you use MacODBC, you should either install it before installing Mac OS 8, or perform a custom install of MacODBC and make sure the ASLM extensions are not selected. The MacODBC installer installs older versions of ASLM extensions that are incompatible with Mac OS 8.

Third-party Finder and utility software

Some third-party programs that extend or add features to Mac OS may be incompatible. Examples include programs that change the way menus work, change how files are stored, or alter the way you work with files in the Finder. Contact the software's manufacturer for information about using such programs with

Mac OS 8. This is especially important if you're using a program that automatically alters the way files are stored (such as compressing them) because you might not be able to access those files until you obtain updated software for use with Mac OS 8.

400K diskettes and Mac OS 8

The 400K MFS diskette format is not supported by Mac OS 8. If you have information or programs on obsolete 400K diskettes that you want to access, copy the files to your hard disk, an 800K diskette, or a 1.44 MB diskette before installing Mac OS 8.

Using the Install Mac OS program

To ensure a successful upgrade, use the Install Mac OS program to install the software. This program unifies the tasks recommended for a successful installation and simplifies the installation process. Refer to the Mac OS 8 installation manual and the onscreen help in the Install Mac OS program for more information.

Troubleshooting suggestions

Disk cannot be updated with the Apple utilities

Some Apple-branded disks manufactured by third parties, including the Apple 365 MB external hard disk, are not supported by the Apple disk utilities. If your disk cannot be updated with the Apple utilities, you will need to use a third-party disk utility to update the driver.

Disk has problems and cannot be repaired message

If you see a message that your disk has problems and cannot be repaired, turn off file sharing if it is on, then try installing again. If that does not work, try using another disk-repair utility. If you do not have another utility, or if that utility also does not work,

you may need to reinitialize the disk. Copy all your files to another disk first, as reinitializing erases the disk. For more information about reinitializing, see the manual that came with your computer.

Problems during installation

If you experience problems during installation, be sure to start up with the Mac OS 8 CD-ROM disc or the Mac OS 8 Install Me First floppy disk. See your installation manual for instructions.

Cannot start up with CD-ROM

If you are installing over a network, or if you have a non-Apple CD-ROM drive and cannot start up with the CD or disk, turn off all extensions that were not provided with your system software. Then restart the computer.

See the troubleshooting chapter in your installation manual for additional suggestions.

Apple, the Apple logo, AppleShare, Macintosh, Mac OS, Performa, PowerBook, Power Macintosh, and PowerTalk are trademarks of Apple Computer, Inc., registered in the U.S. and other countries. Extensions Manager is a trademark of Apple Computer, Inc. PowerPC is a registered trademark of International Business Machines Corporation, used under license therefrom.

Mac OS 8: Internet Explorer Read Me

TOPIC

This article is the Internet Explorer Read Me file that comes with Mac OS 8.0.

DISCUSSION

Microsoft Internet Explorer 3.01 for Macintosh

Thank you for choosing Microsoft Internet Explorer for Macintosh. Although Internet Explorer 3.01 has dozens of new features, by the time you read this, there may already be a new version of Internet Explorer, so please check out <http://www.microsoft.com/ie/mac> periodically for updates.

Microsoft Internet Explorer is a World Wide Web (WWW) browser for the Macintosh. The WWW is the fastest growing component of the Internet today. In order to use a WWW browser, you will need a modem or network access, access to the Internet, and software that enables your computer to communicate with the Internet.

Microsoft Internet Mail and News, our small and fast e-mail client, and Microsoft Personal Web Server, which turns any Mac into a Web serving solution are not included in this installer. You can visit <http://www.microsoft.com/ie/mac> to download these products.

Registering Internet Explorer

We've made it even easier for you to register Internet Explorer 3.01. The first time you open Internet Explorer, you will automatically visit our online registration site at http://www.microsoft.com/ie/ie_reg.htm. Remember that this only occurs the first time you open

..TIL28035-Mac_OS_8-Internet_Explorer_Read_Me_(TA37937).pdf

Internet Explorer after installation. The next time you open Internet Explorer, you will visit your default home page. For more information, see the License Agreement.

Requirements

System Requirements

- Macintosh with 68030 or higher processor
- System 7.1 and higher
- 8 MB of RAM
- 7 MB of hard disk space when Internet Explorer is installed.

Access to the Internet

You must have access to the Internet through an Internet Service Provider or the network to which your computer is connected.

Internet software

- Open Transport 1.0.8 or greater (Extension) or Mac TCP
- If you are a dial-up user, Config PPP or similar PPP connection software (Control Panel) with PPP (Extension)

New Features

Version 3.01 of Internet Explorer represents a surprisingly large number of new features, so be sure to take a look at the following:

JavaScript

JavaScript is the easiest and fastest way for Web authors to add interactivity to a Web site. Unlike Java, which is based on separate software components, JavaScript is a scripting language whose programs are embedded right in the HTML. You can use the Preferences dialog box to turn scripting on and off.

Choose your Java virtual machine

Settings in the Preferences dialog box give you greater control over the use of Java:

- You can choose which Java virtual machine you would like to use:

- Microsoft VM or Microsoft

- JIT. If Apple MRJ is already installed on your machine, you can choose it.

- You can specify whether a warning should be displayed if there are errors in the Java applet

- or whether the browser should save the output text from the Java applet.

Downloading files

The Download File command in the File menu lets you download files from the

Internet while you

continue to browse other Web pages. Once you have typed the URL of the file you want to download, the Download Manager will open and give you information on the status, size, and download time of the file. The Download Manager is also available from the File menu and it keeps a history of the files you have downloaded. You can double-click the downloaded item in the Download Manager for more information.

Internet Explorer now supports folder downloads from FTP and Gopher sites. Drag and drop the folder to the Finder to download the contents of the folder. You can also press and hold down the mouse button over an item on the Web page, and then choose Download Link to Disk from the context menu.

Enhanced download options include automatically decoding BinHex and MacBinary files while the file is being downloaded.

Manage site passwords and user names

The Site Passwords page in the Preferences dialog box maintains a list of the user names and passwords you have used to access a site. Now, you can change access information without going to the site.

Receive updates to your favorite pages

When you mark favorite pages as subscribed pages, Internet Explorer will monitor those sites and notify you, when and if a subscribed page changes. To select how often you want Internet Explorer to look for changes, and how you want to be notified of changes, choose Subscription Options from the Favorites menu.

Note: This is a subset of the Subscription functionality that will be included in the Internet Explorer 4.0 platform preview.

Improved favorites

You can sort favorite items, rename the path, and resize the columns in the favorites list. In addition, you can turn a subscription to a favorite page on and off by clicking in the Subscriptions column (the left most column in the Favorites window). To change subscription information for a particular item, double-click the subscriptions icon located beside the favorite item.

Manage cookies

A cookie is a small piece of information that a Web site downloads on your hard disk for future reference. For example, a cookie might be used to store a customized view of a Web site or ensure that you never see the same advertisement twice. Settings in the Internet Explorer Preferences dialog box let you control the download of cookies. For example, you can choose to always accept cookies or you can choose to always display an alert when a Web site wants to download cookies.

Autosearch

Internet Explorer has made searching the Internet even easier with the Autosearch feature. Simply type go or ? and the topic you'd like to search for in the Address Bar, and Yahoo! (www.yahoo.com) will search its databases for matching topics and display them for you. For example, type ? cooking to find all references to cooking in the Yahoo! database.

Fetch bookmarks

Do you have Fetch bookmarks? Now, you can import them into Internet Explorer. Drag and drop your Fetch bookmarks into the Favorites window of Internet Explorer.

Type ahead in the Address bar

Type an address into the Address bar and Internet Explorer can attempt to complete the address using the contents of your favorites and history lists. First, Internet Explorer will review the names and addresses in your favorites list, and then, if it doesn't find a match, it will review the names and addresses in your history list. For example, if you recently visited the Microsoft site at http://www.microsoft.com, you might need to type only the letters Mic or http://www.mic before Internet Explorer displays the complete address for you.

You can turn off this option by choosing Preferences from the Edit menu, clicking the Browser Display under Web Browser, and then clearing the Auto-Complete Addresses check box.

Refreshing a Web page from the context menu

You can reload a Web page quickly by using the Refresh command from the context menu. This feature is especially useful when you want to refresh the contents of a file contained in a frame. Simply click inside the frame, hold down the mouse button, and choose Refresh from the context menu.

Preferences and Internet Config

Internet Explorer is now more closely integrated with Internet Config and works with the preferences file for Internet Config directly. You no longer have to select whether or not you want to use Internet Config. Any settings you change in the Internet Explorer Preferences dialog box automatically go to the Internet Config Preferences file. If you currently use the Internet Config application, you can continue to do so and the changes you make will automatically appear in Internet Explorer.

More preferences are now available from the Preferences dialog box to better customize your browsing experience. You can control animated GIFs, file downloads, Java VMs, proxies and other features.

ActiveX update

We now have a new version of the ActiveX SDK that supports ActiveX scripting. For more information on this feature, please go to the ActiveX SDK site at <http://www.microsoft.com/intdev/sdk/mac>.

Known Issues

Installing from the CD

Internet Explorer Installer requires that the startup disk of your computer is a hard disk. You will get an error during installation if your startup disk is a CD ROM drive. If this occurs, restart your computer and then run the Internet Explorer installer.

Java

You may not be able to view large Java applets on 8 MB machines when there is not enough system memory free. This occurs because the Java virtual machine is loaded and unloaded dynamically in the system memory. Memory is used only when you view pages with Java applications.

A 68K JIT is not available at this time. If you are a 68K user make sure that you choose the MSIE/MW VM or the Apple VM (if installed). Please visit <http://www.microsoft.com/ie/mac> for updates.

ActiveX

Microsoft Internet Explorer 3.01 for Macintosh has native ActiveX support, and does not require the use of a plug-in. The Microsoft ActiveX Plug-in included with this installer is for use with older versions of Internet Explorer or other browsers that use plug-ins and do not have native support for ActiveX.

Some Web pages may have ActiveX controls that do not support Mac OS. If this happens and you are unable to view the page, you can turn off viewing of ActiveX content. To do so, choose Preferences from the Edit menu, click Web Content under Web Browser, and then clear the Enable ActiveX check box.

Note: Please be aware that in this release, Internet Explorer cannot verify the integrity of ActiveX controls. Download and use ActiveX controls from trusted servers only.

Protocol helpers

You can use the Preferences dialog box to assign protocol helpers. When you do so, please note that the Use Current Application If Possible check box is turned on by default so that if Internet Explorer can handle the protocol, it will be used instead of the assigned helper. For example, if you have assigned Fetch as your current FTP (File Transfer Protocol) helper and have not cleared the Use Current Application If Possible check box, when you click an FTP link in Internet Explorer, Internet Explorer will be used to download the file, not Fetch.

If you do not want Internet Explorer to handle a protocol, be sure to clear the Use Current Application If Possible check box.

Real Player 4.0b1

The current beta version of the Real Player 4.0b1 installer may corrupt the Internet Preferences file, in which Internet Explorer stores its preferences. If this occurs, delete the Internet Preferences file (located in your Preferences folder inside your System folder). The next time you open Internet Explorer, a new Internet Preferences file will be created.

QuickTime and PowerPlug

If you have QuickTime installed, Internet Explorer requires that the QuickTime PowerPlug be installed in the Extensions folder in your System folder. QuickTime extensions are available for download from <http://quicktime.apple.com>.

QuickTime and QuickDraw 3D

If you use the Extensions Manager to disable QuickTime and QuickDraw 3D, you need to remove the appropriate QuickTime and QuickDraw 3D libraries.

VRML

If you are using Internet Explorer to view VRML pages, you must have QuickDraw

3D version 1.5 or
later installed. QuickDraw 3D is available for download from
<http://quickdraw3d.apple.com/>.

Internet Config File Mappings table

Internet Explorer maintains an internal list of viewers that tells it how to handle different types of documents. In this release, this list is exported and merged with the Internet Config File Mappings table. As a result, please consider the following:

Internet Explorer's list of viewers is indexed by the MIME types (Multimedia Internet Mail Extensions) of incoming documents. Since Internet Explorer cannot use a viewer without a MIME type, it will ignore them, but not delete or alter file mappings in Internet Config that do not contain a MIME type.

Internet Explorer maintains only one table entry per MIME type. If you have multiple file mappings in Internet Config with the same MIME type, Internet Explorer will use only the last setting in the table.

Internet Explorer adds a small amount of information to each file mapping in Internet Config to store its How to Handle setting. When you choose Use Explorer as a Viewer, Internet Explorer always attempts to handle the document type, regardless of the settings in Internet Config. Most file formats use the viewer specified in Internet Config, however, certain file formats like GIF and JPEG are handled by Internet Explorer regardless of your Internet Config setting.

Using Help

Internet Explorer Help is available from the Help (?) menu and will give you the information you need to use the powerful features of Internet Explorer.

1. Click a topic area on the left to see a list of related procedures. To open the procedures in a separate window, press and hold on the topic area link and then choose Open Link from the context sensitive menu.
2. Click Index to see the Index. Use the Index just as you would an index in a book.
3. Click Tips & Tricks for information about a particular menu item and its keyboard shortcut.
4. Internet Explorer Help is best viewed in Internet Explorer.

5. Click the Internet Explorer logo at the bottom of the topics list to visit the Internet Products home page at www.microsoft.com/ie/mac.

6. For best viewing, choose Preferences from the Edit menu, click the Web Content tab, and make sure Allow Page To Specify Colors is selected.

7. To print, click in the frame that contains the information you want, and then choose Print from the File menu.

Reporting problems and making suggestions

Send mail to giraffe@microsoft.com with your suggestions. Include:

- System configuration information (on the Apple menu, choose About Internet Explorer, and then click Support).
- Version of operating system
- Type of Macintosh
- Type of connection to the Internet
- Steps that lead to the problem. For example:

1. Start Microsoft Internet Explorer.

2. From the File menu, choose Open.

3. Click the Cancel button.

4. Result: Nothing happens.

Any other information that will help us reproduce the bug successfully.

Although you will not receive a response via e-mail, all your messages will be read and evaluated by the engineering team. We appreciate your feedback.

Technical support

Microsoft offers 90 days of product support at (206) 635-7123 in the U.S. and (905) 568-4494 in Canada. This support is free of charge, except for the cost of the telephone call.

Visit the Internet Explorer for Macintosh home page

Learn more about the many features and updates of Internet Explorer by visiting our home page at <http://www.microsoft.com/ie/mac>.

Join the Internet Explorer for Macintosh newsgroup

Interact with other users of Internet Explorer for Macintosh by joining microsoft.public.inetexplorer.mac. For more information, please visit the

Technical Support

Newsgroup page at <http://www.microsoft.com/support/news/>.

Redistribute Microsoft Internet Explorer--royalty free!

With the Internet Explorer Administration Kit 3.0 for the Macintosh, users can deploy Internet Explorer across an organization, or distribute it with their applications. You do not have to pay royalties when redistributing Internet Explorer, just a small fee for shipping and handling of the CD. To receive the Internet Explorer Administration Kit, check out <http://www.microsoft.com/ie/ieak>.

Java Virtual Machine components for Internet Explorer 3.01

Microsoft Internet Explorer 3.01 Java support is based on the JManager interface as defined by

Apple Computer, Inc. Internet Explorer has an open architecture that supports multiple Java Virtual

Machines such as the Apple Java Virtual Machine, MSIE/MW VM, and MSIE/MW PPC_JIT VM.

To enable Java in Internet Explorer:

1. Choose Preferences from the Edit menu.
2. Click Java under Web Browser, and make sure the Enable Java check box is selected.
3. To change your VM, choose it from the Java Virtual Machine menu.

Java VM pop-up menu will be grayed out, if a Java VM is not installed on your machine. To install

Java VM see the instructions in The Apple VM below.

The Apple VM

Internet Explorer uses the Apple Java Virtual Machine that comes with your system software. If not installed please install it from the Mac OS System Software CD or download and install it from <http://applejava.apple.com/>.

The Microsoft Java VM

The Microsoft Java VM was jointly developed by Microsoft and Metrowerks and is available in two

flavors: MSIE/MW VM and MSIE/MW PPC_JIT VM. You may use either the MSIE/MW VM or MSIE/MW

PPC_JIT VM with Internet Explorer, but one may be better suited to your needs.

The Microsoft Java VM is not included in this version of the Internet Explorer Installer. The MSIE/MW

VM can be downloaded from <http://www.microsoft.com/ie/download>. Follow the instructions to

install, and change Internet Explorer Preferences as noted above to choose from

the different Java
Virtual Machines.

The MSIE/MW VM is installed with Internet Explorer requires less memory and lets you debug Java applets. The MSIE/MW PPC_JIT VM includes technology known as a Just In Time (JIT) compiler. The JIT takes standard Java byte codes and compiles them into native PowerPC instructions. For computational applets, you will see a dramatic increase in speed. Graphics speed, however, will remain largely unaffected. The JIT VM does not support debugging and it requires more RAM because PowerPC code is larger than Java byte-code.

Note: A 68K JIT is not available at this time. If you are a 68K user make sure that you choose the MSIE/MW VM or the Apple VM (if installed).

QuickTime, QuickTime VR, and the QuickTime logo are all trademarks of Apple Computer Inc.
Macintosh is a registered trademark of Apple Computer.

Java is a registered trademark of Sun Microsystems, Inc.

Mac OS 8: MacLinkPlus Read Me

TOPIC

This article is the MacLinkPlus Read Me file that comes with Mac OS 8.0.

DISCUSSION

Contents

- Version 9.0 translation capability
- Version 9.0 new features
- No longer supported
- Limiting the number of translators
- A word about some of the translators
- Version 9.0.2 Bun list of components and their locations
- Complete list of translators in version 9.0
- Contacting technical support

Version 9.0 translation capability

Two new translators have been added since version 8.1: /Quattro Pro for Windows v.7 and WordPerfect for Windows v.7. For a complete list of translators in version 9.0, see the end of this file.

Version 9.0 new features

Numbers and multilevel outlines

MacLinkPlus supports these formats in the following ways:

- ClarisWorks (Mac and Win) v. 3 & 4: bullets, numbers & multilevel outlines supported as ClarisWorks Labels.
- RTF: supports auto bullets, numbers & multilevel outlines.
- Microsoft Word for Mac v. 5.1: supports bullets as characters & numbers as outlines.
- Microsoft Word for Mac v. 6: supports auto bullets, numbers & multilevel outlines. No support

of special auto bullet characters.

Microsoft Word for Windows v. 2 & 6: supports auto bullets, numbers & multilevel outlines.

No support of special auto bullet characters.

Microsoft Works for Mac v. 4: supports bullets only via paragraph style.

Microsoft Works for Windows v. 3 & 4: supports auto bullets only.

WordPerfect for Mac v. 3.x: supports bullets as paragraph style & auto numbers/multilevel outlines.

WordPerfect for DOS: supports bullets, numbers and multilevel outlines as paragraph attributes.

WordPerfect for Windows v. 6 & 7: supports bullets, numbers and multilevel outlines as paragraph attributes.

There is a preference in the MacLinkPlus Setup Control Panel to treat all auto attributes as text. If you are experiencing problems with translation results, this setting will make the resulting document look better in most cases. Be sure to try changing this preference before calling with a problem.

Custom bullet characters and the symbol font characters are not supported at this time.

Bookmarks and hypertext links

MacLinkPlus will convert Hypertext links between two word processors that support this feature. If you are translating from HTML, URLs will be converted to hypertext links in applications that support them, and into blue underlined text in applications that do not. There is also a preference in the MacLinkPlus Setup control panel to reference the URLs in HTML documents as footnotes.

The following word processors support Bookmarks and Hypertext links:

Word 6.0 Mac (with Internet Assistant)
RTF (opened in Word with Internet Assistant)
Word 6.0 & 7.0 Windows (with Internet Assistant)
WordPerfect 7.0 Windows
WordPerfect 3.5 Mac

Absolutely positioned objects (text and graphic frames)

In most newer word processors graphics can be placed into a document in one of two ways: Inline

or absolutely positioned. If they are inline, that means that they flow with the text in the document. If

they are absolutely positioned, they are anchored to a page, margin, paragraph or some other

geographic place in a document. In versions prior to 9.0, MacLinkPlus only

supported inline
graphics. With 9.0 we have begun to support absolutely positioned graphics and
text frames in the
following applications:

- ClarisWorks 2.x, 3 & 4.0
- MacWrite Pro
- RTF
- Word 5.1 (Mac)
- Word 2.0 (Windows)
- Word 6.0 & 7.0 (Mac & Windows)
- WordPerfect 5.1, 6.0 & 7.0 (Windows)
- WordPerfect 2, 3 & 3.5 (Mac)
- Microsoft Works 4.0 (Mac)
- Microsoft Works 3.0 & 4.0 (Windows)

No longer supported

In Version 9.0, we have removed support for Microsoft Word External Converters
and Microsoft

Works Converters. This means that you will no longer be able to access the
MacLinkPlus

translators from the open or save as dialogs in these two applications. You
will, however, still be

able to translate to and from Microsoft Word and Works through our recommended
translation

systems such as Mac OS Easy Open and the Document Converter. The reason the
functionality was

removed is that our translators have moved beyond the capabilities of these
translation delivery

systems. The MacLinkPlus installer will move them from their existing positions
and place them in a

folder in the MacLinkPlus 9.0 folder called No Longer Supported.

Limiting the number of translators

In order to reduce disk space or system requirements related to MacLinkPlus, it
is now possible to

disable selected translators. Removing infrequently used translators will speed
up System startup

and Document Converter setup. It will also make the removed translators
inaccessible from any of

the recommended translation methods like Mac OS Easy Open, Document Converter,
XTND and the

MacLinkPlus application.

The MacLinkPlus Installer will allow you to reinstall the entire translation
library should you find that

a translator has been inadvertently deleted from your hard drive.

Create a folder called Unused Translators in the DataViz folder in the System
folder and place

infrequently used translators in that folder to disable them. To enable them,
put the translator files

back in the DataViz folder root level and restart.

A word about some of the translators

AmiPro 3

Although AmiPro supports APOs & AutoBullets/Numbers, support for these features was not added for version 9.

In the case of APOs, the Ami Pro translator will attempt to place absolutely positioned objects as inline graphics whenever possible. If the translator is unable to determine where in the document the object is intended to be placed, it will insert all graphics at the beginning or end of the document, depending on the original file format being converted.

In the case of AutoBullets and Numbers, use the Convert to Text option in the MacLinkPlus Setup Control Panel for best results.

ClarisWorks 4

ClarisWorks allows you to embed spreadsheets inside word processing files. If MacLinkPlus encounters a spreadsheet while translating a word processing file, that spreadsheet will be converted to a table. If that spreadsheet is anchored to text, it will be placed at the end of the paragraph. If that spreadsheet is floating (anchored to the page) then it will be placed at the end of the document.

WordPerfect 6.0 and WPG2 graphics

In translations FROM WordPerfect 6.0, if the Mac OS system doing the translation does not have a math co-processor installed, files which contain embedded graphics may appear to be frozen while the translation is going on. Be patient, especially if the WordPerfect file contains several graphics. This is also true if you are translating a stand-alone WPG2 graphic file (i.e. not embedded into a word processing file).

Nisus and NisusWriter

In translations FROM Nisus, graphics will be properly converted to other applications (where supported). However, if a graphic is placed in an unanchored frame in the Nisus document, it will be placed at the end of the resulting document. Graphics placed in anchored frames will remain in their original locations.

OLE translations

Translations of large OLE documents can be very memory-intensive. If problems

are encountered,
you may wish to increase the memory available to your application by increasing
the Preferred Size
in Get Info for the application. (Supported OLE applications are: Excel 5.0,
Word Macintosh 6.0, Word
for Windows 6.0 & 7.0, MS Works Macintosh 4.0, and MS Works for Windows 3.0 &
4.0)

Version 9.0.2 Bun list of components and their locations

*Made by Apple Computer

DataViz folder

The DataViz folder must be at the root level of the System Folder on the startup
drive and must be
named DataViz. There are 88 items in the v.9 DataViz folder. The following list
of translators is for the
Power Mac version. The 68k version translator filenames contain 68k at the end
of the name.

- Ami Pro 2.0, 3.0, 3.1
- AppleWorks DB
- AppleWorks SS
- AppleWorks WP 2
- AppleWorks WP 3

MacLinkPlus Bridge

The MacLink Plus bridge is located in the Claris Translators folder, in the Claris folder, in the System Folder.

DataViz FileView

The DataViz FileView can reside anywhere on your Mac, but is most likely in the MacLinkPlus folder, in the Applications folder or an alias is on the desktop.

Document Converter

The Document Converter can reside anywhere on your Mac, but is most likely in the MacLinkPlus folder, in the Applications folder. The name of the Document Converter can change when it has been set. For example, it can be called "to Claris Works 3.0 WP document." Also, you can have more than one Document Converter. To locate the Document Converter(s) on your Mac, choose File from your menu bar, and select Find. Search for items on your hard drive whose creator is tra". This will display Document Converter(s) and location(s).

MacLinkPlus folder

The MacLink Plus folder can be located anywhere on your Mac, but is installed at the root level of your hard drive. Most users choose to keep it in their Applications folder. The contents of the MacLinkPlus folder will vary depending upon your product. The basics include:

Document Converter

Complete list of translators in version 9.0
Below is a complete list of the file formats supported by MacLinkPlus version 9.0.

Note: Macintosh formats can be translated into PC formats in the same category and vice versa (i.e., any Macintosh word processing format can be translated into any PC word processing format, any PC spreadsheet can be translated into any Macintosh spreadsheet, etc.). In addition, Macintosh formats can be translated to other Macintosh formats (e.g., Microsoft Word to ClarisWorks, Excel to MS Works spreadsheet). For graphic translations, the actual translation paths are noted.

Macintosh word processing formats
The following formats are translated "from" only.

ClarisWorks v. 1, 2, 3 & 4
FrameMaker MIF v. 2 & 3
MacWrite v. 4.5 & 5
MacWrite II
MacWrite Pro v. 1 & 1.5
Nisus

Mac OS 8: QuickDraw 3D Read Me

TOPIC

This article is the QuickDraw 3D Read Me file that comes with Mac OS 8.0.

DISCUSSION

Important Information About QuickDraw 3D

QuickDraw 3D enables your computer to display three-dimensional graphics using applications

designed to take advantage of QuickDraw 3D. It also provides a common file format, called

QuickDraw 3D Metafile (or 3DMF for short), for exchanging 3D documents.

QuickDraw 3D also

provides acceleration services which support plug-and-play accelerator cards.

For computers running the Mac OS, the following are required to install and run QuickDraw 3D:

- a PowerPC based computer with a minimum of 16 megabytes of memory (RAM)
- Mac OS System 7.1.2 or later

The latest version of QuickDraw 3D, along with software demos, QuickDraw 3D Metafiles, and additional information is available through the Internet at the following site: <http://quickdraw3d.apple.com/>.

Using QuickDraw 3D

The QuickDraw 3D folder includes the following applications, 3D models, and textures that allow you to explore the 3D capabilities of your computer:

- SimpleText version 1.3.1 and Scrapbook version 7.5.2. These applications allow you to open

- and interact with 3DMF models.

- A new Scrapbook File with sample 3DMF models.

- A number of 3DMF models provided by Model Masters

- (www.interaccess.com/modelmaster), Plastic Thought, Inc (www.3d-active.com),

- Viewpoint DataLabs International (www.viewpoint.com), and Zygote (www.zygote.com).

You can expect even more applications that use QuickDraw 3D in the near future, including new versions of application programs you may already own. Contact your software vendors for more information about their plans to support this new technology.

Troubleshooting

If you try to start an application that uses QuickDraw 3D and get the message "The application 'application name' could not be launched because QuickDraw 3D could not be found," make sure that the following files are in the Extensions folder, inside the System Folder:

- QuickDraw 3D
- QuickDraw 3D IR
- QuickDraw 3D RAVE
- QuickDraw 3D Viewer

If the files are there and you still get the message, it means that you do not have enough memory to run the application. You may be able to open the application if you try the following:

- Quit other open applications.

Reduce the amount of memory allocated to the application. This is done by:

1. selecting the application's icon in the Finder
2. choosing Get Info from the File menu
3. typing a lower number in the boxes for Minimum Size and Preferred Size.

- Install more memory (RAM).

Using US software on a localized system

If you are using a localized system, and you install this U.S. software, you will need to copy the Scrapbook File in the QuickDraw 3D Folder to the System Folder on your computer. Otherwise, when you choose Scrapbook from the Apple menu, you will get an empty scrapbook. Note that this operation will replace any existing Scrapbook File in the System Folder, thus erasing any previously stored contents.

Using highly detailed models

Some of the sample models included with QuickDraw 3D, such as Big Ben and Red

Hatchback, are highly detailed (they contain additional 3D modeling data such as vertex normals and surface UVs) and thus will require a larger amount of memory than the other supplied models. If you experience problems when opening these files from SimpleText, you should open only one file at a time.

How QuickDraw 3D uses memory

QuickDraw 3D is a shared library. When no applications that rely on QuickDraw 3D are open, the library does not take up memory space (RAM). Once a QuickDraw 3D-based application is open, the amount of memory taken up by the shared library does not increase if other QuickDraw 3D-based applications are launched. Of course, each application will take up memory according to their size and the complexity of the files being used. The memory taken up by QuickDraw 3D becomes available when you quit all QuickDraw 3D-based applications.

While a QuickDraw 3D application is open, the QuickDraw 3D library allocates memory from temporary memory. This memory shows up in the About This Macintosh window as memory used by the system. When you quit the application, the memory becomes available, but the size shown in the About This Macintosh window may not reflect this. The memory previously used by QuickDraw 3D is, nonetheless, available for other applications (it is released to the applications as needed).

Apple QuickDraw 3D Accelerator Card

If you have an Apple QuickDraw 3D Accelerator Card present in your machine, the following files will also be installed in the Extensions folder, inside the System Folder:

- Apple QD3D HW Driver
- Apple QD3D HW Plug-In

If you need to re-install these files at a later time, you can do so by:

1. launching the installer, as described in the section below under If you need to reinstall QuickDraw 3D
2. selecting Custom Install from the pop-up menu
3. selecting the Apple QuickDraw 3D Accelerator Card item in the list.

We recommend that you turn off Virtual Memory when using Apple's QuickDraw 3D Accelerator Card.

Scrapbook 7.5.2

We strongly recommend that the Scrapbook not be used with less than 300k of memory available.

To determine how much memory is available, select About This Macintosh from the Apple menu and look at the value next to Largest Unused Block.

If you need to reinstall QuickDraw 3D

If you need to reinstall QuickDraw 3D, follow these steps:

1. Open the QuickDraw 3D Install folder and double-click the installer icon.
2. After installing QuickDraw 3D, restart your computer.
3. If you want the items in the QuickDraw 3D Extras folder, drag the folder to the newly-created QuickDraw 3D Folder inside the Apple Extras folder.

Removing QuickDraw 3D

If you wish to remove QuickDraw 3D, follow these steps:

1. Open the QuickDraw 3D Install folder and double-click the installer icon.
2. Choose Custom Remove from the pop-up menu.
3. Click the box next to each item to put a check in it.
4. Click Remove.
5. Restart your computer.

Mac OS 8: ARA Client Read Me

TOPIC

This article is the ARA Client Read Me file that comes with Mac OS 8.0.

DISCUSSION

This document provides late-breaking news about the Apple Remote Access Client that is not covered in the Apple Remote Access Client User's Guide. You may need to refer to that guide to understand the use of several terms in this document, and you may want to print this document to keep with your user's guide.

Modems Supported by the Apple Remote Access Client

Scripts that support most popular modems are provided on the Remote Access Client installation disks. The scripts include:

- 3Com Impact Analog 14.4
- 3Com Impact ISDN 56K
- 3Com Impact ISDN 64K
- Apple Modem 2400
- AT&T Dataport 288
- AT&T KeepInTouch
- Dayna CommuniCard 28800
- Farallon Netopia 56K
- Farallon Netopia 64K
- GeoPort/Express Modem
- GeoPort/Express Modem CNG
- Global Village Gold/Silver/Mercury
- Global Village Platinum
- Hayes Accura 288
- Hayes Optima 14.4
- Hayes Optima 288
- Megahertz CruiseCard 14.4

Megahertz CruiseCard 28.8
Metricom Ricochet Wireless
Microcom MicroPorte 4232bis
Microcom QX/4232bis
Motorola 326xV34
Motorola BitSURFR 56K
Motorola BitSURFR 64K
Motorola Power/Lifestyle 28.8
Practical Peripherals V.34
Prometheus ProModem 144e
Prometheus ProModem 96
PSI PowerModem II
PSI PowerModem III/IV
Supra 144
Supra 288
TDK DF2814
Telebit QBlazer
Telebit T3000
Telebit Worldblazer
US Robotics Universal
Zoom V-series

Beginning with version 2.1 of the Apple Remote Access Client and the companion Personal Server product, modem scripts are no longer stored in the Extensions Folder. A new folder called Modem Scripts within the Extensions Folder is created by Apple Remote Access to hold modem scripts.

The Apple Remote Access Installer will move any existing scripts you may already have in your Extensions Folder to the new Modem Scripts folder in addition to placing scripts for all the modems listed above into the Modem Scripts folder.

Future remote access products from Apple will also use the Modem Scripts folder. However, there will be a transition period before other products are updated to use the new folder. Some existing products may install modem scripts into the Extensions Folder. If such a product is installed after Apple Remote Access 2.1, you will have to open your Extensions Folder and drag the scripts into the Modem Scripts folder in order for Apple Remote Access to recognize the script.

You can use modem scripts included with the Apple Remote Access MultiPort Server (any version) with version 2.1 of Apple Remote Access Client. You can also use AppleTalk Remote Access version 1.0 modem scripts with version 2.1 of the Client, but certain new features, such as Ignore Dial Tone, Manual Dialing, and MNP 10 support, will not be available.

..TIL28038-Mac_OS_8-ARA_Client_Read_Me.pdf

Additionally, you will be able to use scripts from future Apple dial-up products with version 2.1 of Apple Remote Access. But, see the note below on some issues related to manual dialing.

Apple Remote Access and System 7.5.3

The Read Me documents for System 7.5.3 and System Update 2.0 suggest that Apple Remote Access should be installed before System 7.5.3. This is not necessary. Beginning with version 2.1, Apple Remote Access should be installed after System 7.5.3.

Installing ARA X.25 Client over Apple Remote Access 2.1

The Apple Remote Access X.25 Client installer places X.25 scripts into the Extensions folder. If you install the X.25 additions after installing Apple Remote Access 2.1, you will have to open your Extensions Folder and drag the X.25 scripts into the Modem Scripts folder in order for Apple Remote Access to recognize the scripts.

If you use the Apple Remote Access 2.1 installer to upgrade your existing Remote Access 2.0.1 and X.25 Client, the installer will move the scripts for you.

Compatibility with AppleTalk Remote Access 1.0

Version 2.1 of the Apple Remote Access Client will successfully connect to both AppleTalk Remote Access 1.0 compatible servers and Apple Remote Access 2.x compatible servers. The compatibility setting in the connection document of earlier version 2.0 and 2.0.1 has been removed. Since connection to either style server is automatic, the setting is no longer necessary.

The next major upgrade to Apple Remote Access will no longer support ARA 1.0 clients or servers.

Using an MNP 10 Modem

MNP 10 is an error-correction protocol that allows for more reliable data connections over cellular modems. Clicking the Use MNP 10 error correction in modem checkbox in the Remote Access Setup window puts MNP 10 modems into cellular mode. Do not click the Use MNP 10 error correction in modem checkbox to use MNP 10 over land lines.

To establish an MNP 10 connection, both your modem and the modem you are calling must support MNP 10; clicking the Use MNP 10 error correction in modem checkbox in the Remote Access Setup window is not by itself sufficient to establish an MNP 10 connection.

Manual Dialing

The method used to do manual dialing in Apple Remote Access 2.0/2.0.1 has not worked well.

Apple Remote Access presents a dialog asking you to dial, wait for the phone to ring, and then press OK. Often the user has to experiment to determine exactly when to press OK to dismiss the dialog.

To improve manual dialing, a new dialog has been incorporated into the modem scripts installed along with version 2.1 of Apple Remote Access. Two dialogs are now displayed when doing manual dialing. This first dialog is still present to provide backwards compatibility with the wide variety of existing modem scripts. When using newer scripts, the first dialog box should be dismissed before dialing, and you will be prompted by the modem script when to actually dial the phone. If you are using a modem script not included with this product, you may have to experiment to determine if the first dialog box should be ignored.

Future remote access and dial-up products from Apple will require the new style scripts and will not present two dialog boxes.

Using the Redialing Feature

If the redialing option is selected, the Remote Access Client attempts redialing only when the phone number that has been dialed is busy. If the connection attempt fails for any other reason including a failed callback attempt, Remote Access stops redialing so that you can correct any problems.

If you use the Redialing option, set the Time between retries number to five seconds or greater. Anything less than five seconds may not give your modem sufficient time to reset.

When using the Redialing Alternate Number option, the main number is dialed once and then redialing sequence alternates between the alternate and main numbers.

Using DialAssist

If you are calling within a country with no city or area codes, and you encounter problems using DialAssist, try entering a space in the Connect To City/Area Code box in your connection document.

Serial Port Arbitration

When a Remote Access connection is established, Remote Access prevents other application

programs from using the serial port selected in the Remote Access Setup control panel. Most programs will inform you that the port is in use.

Remote Access Client provides this port arbitration through a system extension called the Serial Port Arbitrator located in the Extensions folder. Some programs that use the serial port may not be compatible with this extension. If you suspect that a program is not compatible with the Serial Port Arbitrator:

1. Remove the Serial Port Arbitrator file from the Extensions folder.
2. Restart your Macintosh.
3. Try the program again.

Note: The Serial Port Arbitrator will not work on a Macintosh if Remote Access Client has not been installed.

High Speed Serial Connections

Both Apple Remote Access Personal Server 2.1 and Client 2.1 support specifying a serial connection speed of 115200 bps in a modem script. Not all Macintosh built-in serial ports support connection speed of 115200 bps. Here is a list of Macintoshes that do.

Centris/Quadra 660AV, Quadra 840AV
Macintosh Performa 61xx
Power Macintosh 61xx, 71xx, 72xx, 75xx, 76xx, 81xx, 85xx, 95xx
Workgroup Server 6150, 7250, 8150, 8550, 9150

In order to use the serial port at 115200 bps on one of these computers, you need a new serial extension called SerialDMA. System 7.5.3 or later incorporates this driver into the operating system.

If you use a modem script that specifies 115200 bps, and your computer does not support this data rate, Apple Remote Access will automatically fall back to 57600 bps.

Using a Local Printer

If you are using a non-networked printer connected to the printer port of your Macintosh, you may get an error dialog when trying to initiate a connection or when trying to print while connected saying that one of your serial ports is already in use. You may need to select Remote Only in the Network Control Panel (AppleTalk Control panel for Open Transport-based machines).

Apple Remote Access Client and the Apple Internet Router
Apple Remote Access Client should not be installed on the same Macintosh as the Apple Internet Router.

Using ARA Security Modules (like SecurID) with Virtual Memory
There is an incompatibility between some ARA security modules (like SecurID) and Virtual Memory.
This bug has been fixed in the latest system release (7.5.3).

Changes in version 2.1 of the Apple Remote Access Client

Modem scripts have been moved to a new Modem Scripts folder within the Extensions

Folder.

The compatibility option in the connection document is no longer necessary and has been removed.

The method of manual dialing has been changed. See the section above.

Interoperability with some non-Apple Remote Access Servers has been improved.

The installer has been upgraded from version 3.4 to version 4.0.3.

There is no longer a separate Remote Access Aliases extension.

The installer is now on a single high-density diskette.

A bug that caused machines with certain extensions to crash during boot has been fixed in

the Serial Port Arbitrator.

Serial port rates of up to 115,200 bps are now supported in modem scripts. If the computer

doesn't support 115,200, Apple Remote Access will use 57,600 bps instead.

Apple, AppleTalk, Macintosh, Macintosh Quadra, and PowerBook are trademarks of Apple Computer, Inc., registered in the United States and other countries. DialAssist and GeoPort are trademarks of Apple Computer, Inc. SecurID is a trademark of Security Dynamics.

Mac OS 8: Before Installing OT/PPP

TOPIC

This article is the Before Installing Open Transport/PPP 1.0.1 Read Me file that comes with Mac OS 8.0.

DISCUSSION

Introduction

This document contains late-breaking information about Open Transport/PPP. For instructions about how to use Open Transport/PPP--including the Modem and PPP control panels--see the Open Transport/PPP User's Manual. Onscreen help is also available in Mac OS Guide. Choose Help from the Help menu. Information about Open Transport/PPP appears in the Telecommunications topic area. Or you can click the question-mark icon that appears in the Modem and PPP control panels.

Additional information about Open Transport/PPP is also available on the Open Transport/PPP home page: <http://devworld.apple.com/dev/opentransport/ppp.html>. Included on this home page is a log of the release notes that describes the changes in each beta release of the Open Transport/PPP software.

License Agreement

This release of Open Transport/PPP is subject to the terms and conditions of the license agreement that accompanies the software in the file named License. By using the software you agree to abide by the terms and conditions of the license agreement.

System Requirements

Open Transport/PPP 1.0.1 is designed to work on Mac OS-compatible computers with a Motorola 68030- or 68040-family microprocessor, or a PowerPC 601, 603e, 604, or 604e microprocessor.

..TIL28039-Mac_OS_8-Before_Installing_OT-PPP.pdf

You also need Mac OS System 8.0 or later and Open Transport 1.1.2 or later.

IMPORTANT: You must install Open Transport 1.1.2 or later before installing Open Transport/PPP.

Open Transport/PPP 1.0.1 requires a minimum of 500K of RAM (for 68030- or 68040-based computers) or 600K of RAM (for PowerPC-based computers). Open Transport/PPP memory requirements are based on the size of total system memory, including virtual memory, minus the size of any RAM disk or disk cache you are using.

Apple Software Update Sites

Information about updating Apple software is available online on the World Wide Web and other online servers. On the Web, go to either of the following sites:

www.info.apple.com

www.support.apple.com

Both of these sites provide links to the Apple Software Updates page.

These sites also provide links to the Technical Info Library (TIL). By searching for "find apple software updates" in the TIL, you can find Apple Software Updates locations for Internet, America Online, CompuServe, and other online services.

Once you reach an Apple Software Updates site, use the following path to locate the Open Transport software:

Apple SW Updates

US

Macintosh

Networking-Communications

Open Transport

Before You Install Open Transport/PPP 1.0.1

- Make backup copies of the software and documents on your hard disk (especially your System Folder) before installing this software.
- If you already use SLIP or PPP software to access the Internet, make a note of the configuration

information that you entered into your previous SLIP or PPP control panels. Configurations are not automatically converted from third-party SLIP or PPP software.

What's New In Open Transport/PPP 1.0.1?

- The OpenTpt Serial Arbitrator no longer crashes with extensions that open a serial driver during system startup (such as the Wacom Tablet driver).
- Open Transport/PPP does not display dialog boxes for background-only applications (such as Personal Web Sharing). NOTE: When opening a PPP connection from a background-only application, the machine will appear frozen until the connection is established.

Known Incompatibilities and Limitations

- Open Transport 1.1.2 or later is required for use with Open Transport/PPP 1.0.1. You should not attempt to use Open Transport/PPP with a previous version of Open Transport.
- ARA 2.x modem CCL scripts can be used with Open Transport/PPP. However, some ARA 2.x scripts do not support modem-based error correction and data compression, so performance may not be optimal. You should try to use one of the modem scripts provided with Open Transport/PPP. If you can't find one that matches your modem, you can modify an existing script to suit your needs.
- If you are using both ARA 2.1 and Open Transport/PPP, be sure to install Open Transport/PPP after ARA 2.1 to get the correct set of modem scripts for both products.
- If you are running Open Transport/PPP on a desktop Macintosh that has sleep capability, your Open Transport/PPP connection will not be automatically terminated when you choose Sleep from the Special menu, because sleeping desktop computers can continue network activity (unlike PowerBook models). If you do not want to remain connected to your PPP server when you put your desktop system to sleep, disconnect manually using the PPP control panel.
- If you have a copy of Open Transport/PPP older than 1.0f1c2 installed, you must discard your old Open Transport/PPP preferences files. To do so, remove the Remote Access folder from the active Preferences folder. Restart your computer and then use the Modem and PPP control panels to customize your configuration.

- Open Transport/PPP 1.0.1 has some incompatibilities with the Apple Express Modem. If the Internal Modem choice does not appear in the Modem control panel's Port pop-up menu, uncheck the "Use internal modem instead of Modem/Printer port" checkbox in the Express Modem control panel and restart. Then open the Modem control panel again.
- You may experience some difficulty with older application programs that do not use Open Transport and try to use the serial port while PPP is active. The workaround is to disconnect PPP using the PPP control panel before starting up the older application.
- Claris EMailer version 1.1v3 or later is compatible with Open Transport 1.1.1 or later. A problem in the Quit command of earlier versions of Claris EMailer sometimes causes a crash with Open Transport 1.1.x (with or without Open Transport/PPP). For your convenience, the Claris EMailer version 1.1v3 patcher and Claris EMailer Lite version 1.1v3 patcher have been provided in the Open Transport Extras folder.
- You may experience CD and TV sound problems when you are dialing your Internet service provider from a Performa 6300CD computer. The workaround is to launch Megaphone before trying to connect.
- When entering phone numbers for the Motorola BitSURFR Pro 56K and 64K ISDN terminal adapters, do not use dashes or spaces between the numbers. For example, "555-9999" should be entered as "5559999". Entering spaces or dashes may prevent successful connections with the BitSURFR Pro, particularly when two ISDN channels are used.
- If you use PortShare Pro from Stalker GmbH to set up a virtual modem or virtual printer port, the ports appear as Modem or Printer, respectively, in the Modem control panel. They do not appear as Virtual Modem or Virtual Printer. PortShare Pro replaces the serial drivers for the on-board modem/printer ports with its own, so selecting Modem or Printer causes Open Transport/PPP (and any other native Open Transport serial application) to use the replacement drivers.
- Open Transport/PPP will report the single channel speed of 56 Kbps or 64 Kbps. The 112 Kbps or 128 Kbps speeds are used but not displayed when using a second ISDN channel with

multilink

PPP. Use the terminal adapter to find out the speed of the second channel.

Compatibility with the Apple Internet Connection Kit

You can install both Open Transport/PPP and the Apple Internet Connection Kit (AICK) on your computer at the same time. Both products enable you to dial with your modem and connect to the Internet.

At the time of this release, AICK does not use the Open Transport/PPP software to dial and connect to the Internet. AICK has its own Dialer, which uses MacPPP software to establish the remote connection. MacPPP is a third-party implementation of the Point-to-Point Protocol.

All of the AICK applications, however, are compatible with Open Transport/PPP 1.0.1. To use Open Transport/PPP with AICK applications, you must configure Open Transport/PPP as described in the Open Transport/PPP User's Manual and in the "Connecting to the Internet" topic area of Mac OS Guide.

The currently active PPP software is selected using the "Connect via" pop-up menu in the TCP/IP control panel. MacPPP is listed as MacPPP. OT/PPP is listed as PPP. MacPPP is controlled by using the ConfigPPP control panel, the Apple Internet Dialer application, or the Apple Internet Status application. Open Transport/PPP is controlled by using the Modem and PPP control panels, which do not modify or change MacPPP configuration information.

If you use both PPP software packages (one at a time), note that launching either the Apple Internet Dialer or Apple Internet Status will make MacPPP active. Furthermore, you will need to switch TCP/IP configurations each time you switch from one PPP software package to the other. (Information about changing TCP/IP configurations appears in the Network topic area of Mac OS Guide.)

Modem Support

Scripts that support many popular modems are provided on the Open Transport/PPP installation disks. The scripts include:

3Com Impact Analog 14.4

3Com Impact ISDN 56K

3Com Impact ISDN 56K MLPPP

3Com Impact ISDN 64K

3Com Impact ISDN 64K MLPPP

Telebit QBlazer

US Robotics Universal

Zoom V-Series

Apple now installs all modem scripts in the Modem Scripts folder (in the Extensions folder) instead of directly in the Extensions folder. Open Transport/PPP does not recognize modem scripts stored outside the Modem Scripts folder.

Auto-routing of modem scripts has been disabled by the Installer. Once Open Transport/PPP is installed, a modem script will not be routed to the Extensions folder if it is dragged into an active System Folder.

The Easy Install mode of the Installer copies all of the Open Transport/PPP modem scripts on your disk. You can choose Custom Install to limit the installation to only the scripts you choose.

NOTE: You can delete any unneeded scripts from the Modem Scripts folder, which is located inside the Extensions Folder. To recognize scripts, look for files of the kind "Modem Link Tool Personal document."

Additional (Unsupported) Modem Scripts

User-contributed scripts are available online. New modems are regularly introduced and Apple is willing to help publish scripts donated by users to aid in making Apple Remote Access and Open Transport/PPP work easily with as many modems as possible.

IMPORTANT: User-contributed scripts are not tested or supported by Apple Computer, Inc., so you should contact the script's author rather than Apple if you run into difficulty using a script downloaded from the unsupported folder. User-contributed modem scripts are provided on an as-is basis as a convenience to Apple customers. They are not warranted to be complete or free from errors, although Apple may choose to review and fully test some user-contributed scripts and include them in future versions of Apple software. If you want to provide Apple with feedback about particular user-contributed scripts, send electronic mail to the following address: msg@apple.com

To find these scripts, go to any Apple Software Updates location and use the following path:

Apple SW Updates

US

Macintosh

Unsupported

CCL

If you want to contribute a modem script, please use the following procedure:

1. Download the sample Read Me file from the User-contributed scripts folder. The file is named

CCL_README_TEMPLATE.

2. Customize the sample Read Me as appropriate for the script you want to submit.

3. Send electronic mail to msg@apple.com and enclose the script in BinHex format.

Scripts will only be posted if they are accompanied by a Read Me explaining the script's purpose and how to contact the author.

(See "Apple Software Updates Sites" near the beginning of this Read Me for information on how to find Apple Software Updates locations.)

Modem Cable Requirements

Most modems require a cable that supports the data terminal ready (DTR) signal. In addition, certain modems require a cable that supports CTS/RTS hardware flow control. To support DTR, the cable must connect pin 20 on the DB-25 connector to pin 1 on the Mini DIN-8. To support CTS/RTS, the cable must connect pin 5 on the DB-25 connector to pin 2 on the Mini DIN-8 and pin 4 on the DB-25 connector to pin 1 on the Mini DIN-8. Contact your modem vendor or Apple-authorized dealer to obtain the necessary cable.

Open Transport/PPP and Apple Remote Access Compatibility

Open Transport/PPP and ARA versions 1.0, 2.0, 2.0.1, and 2.1 are fully compatible and can be used on the same system. Only one can be used at a time.

Versions of ARA before 2.1 install modem scripts directly in the Extensions folder. To make sure that these scripts appear as choices in the Modem control panel, move them to the Modem Scripts folder in the Extensions folder.

ARA 2.1 installs its scripts in the Modem Scripts folder in the Extensions folder. If you are using ARA 2.1, you must install Open Transport/PPP 1.0.1 after ARA 2.1 to get a set of scripts in the Modem Scripts folder that works optimally with both products. The Open Transport/PPP scripts support certain modem-based features, such as error correction and data compression, that improve PPP performance. The ARA 2.x scripts may not support these features.

Also, some scripts included with ARA 2.1 are no longer installed with Open Transport/PPP. These scripts are left on your disk by the Open Transport/PPP installer. They may be usable with Open Transport/PPP, but have not been tested for compatibility by Apple.

Registered User or Guest?

If your PPP server does not require a user name and password, or if the server requires only that you enter a name and password in a terminal window, you can select the Guest mode button in the

PPP control panel. This will hide the Name and Password fields and will cause the Connect button to be enabled as soon as you enter a phone number.

If your server requires a PPP user name and password instead of, or in addition to, a terminal server login, you must use the Registered User mode of the PPP control panel. In this mode, you must enter something in the Name and Number fields to enable the Connect button. If you leave the Password field blank, and "Save password" is not checked, you will be prompted to confirm that you want to connect without a password.

Connect Scripts

The following varStrings have been added to the CCL scripting language for the user name and password:

Name: ^11 or ^U

Password: ^12 or ^P

When the connect script is executed, these varStrings are replaced by the strings stored in the Name and Password fields of the PPP control panel.

When you record a connect script, and you have entered your name and password in the PPP control panel, the connect script that is recorded by the terminal window will replace those strings with the appropriate varStrings.

The ^U and ^P varStrings are provided as mnemonics for the user name and password, but they cannot be used as parameters of some CCL commands like IFSTR. With those commands, use the ^11 and ^12 varStrings instead.

Connection CCL scripts that use the password varString (^12) in WRITE commands do not log the password in clear text. The password is logged as bullets. This is true whether the user records the script or types it in.

More detailed information about the syntax of the CCL language used for both modem scripts and connect scripts is in the ARA Modem Scripting Guide.PDF file in the OT/PPP Extras folder. This file is in Adobe Acrobat format.

Manual Dialing

Procedures for establishing an Open Transport/PPP connection with manual dialing vary according to the type of modem you are using. To ensure that you can make a connection while using manual dialing, you may need to experiment with pressing the Connect button slightly before or after you hear the remote modem answer the phone.

Using an Express Modem or GeoPort Telecom Adapter

If you are using Express Modem software with either an Express Modem or a GeoPort Telecom Adapter, you must turn on 32-bit addressing in the Memory control panel. Using 24-bit addressing may result in incorrect behavior.

Using Global Village PC Card Products

The Global Village software included with your modem adds an entry to the "Connect via" pop-up menu of the Modem control panel called "PowerPort PC Card". Under some circumstances, an entry for the actual slot your PC Card is plugged into will show up as well ("Upper-slot," "Lower-slot"). These slot-specific items should not be used and the "PowerPort PC Card" item should be used instead or the port will be erroneously reported as busy.

Using an ISDN Terminal Adapter

Both Open Transport/PPP 1.0.1 and ARA 2.1 support serial connection speeds of 115,200 and 230,400 bps. By doing so, Apple enables Macintosh users to make ARA and PPP connections over ISDN lines at 64 kbps or even 112 kbps if the ISDN terminal adapters at both ends support channel bonding and proper modem scripts are used.

NOTE: The "Connected at" line of the PPP control panel status box may not accurately reflect the connection speed of ISDN connections. A slower speed may be indicated because ISDN terminal adapter hardware does not report the establishment of second channel connections to the CCL script engine. This will usually happen if you use the Multilink PPP (MLPPP) version of an ISDN script.

Connection speeds of 115,200 and 230,400 bps are not supported by the serial ports on most older Macintosh computers. Here is a partial list of Macintosh models that have fast serial port support:

- Macintosh Centris 660AV, Macintosh Quadra 660AV and Macintosh Quadra 840AV models
- Macintosh Performa 6100CD series
- Power Macintosh 6100, 7100, 7200, 7500, 7600, 8100, 8500, and 9500 models
- Workgroup Server 6150, 7250, 8150, 8550, and 9150 models

To set the built-in serial ports at 115,200 or 230,400 bps, a new serial driver called SerialDMA must be installed to replace the standard Macintosh serial device driver. SerialDMA is provided by Apple, and the current version is 2.0.2. It is highly recommended that the file Serial (Built-in) be installed in the Extensions folder as well on Macintosh models with PCI slots to support these high speeds (38,400 bps and above). System 7.5.3 or later includes the latest version of SerialDMA and the file Serial (Built-in).

NOTE: In general, ISDN terminal adapters have more configuration options than conventional modems. At this time it is not possible for Apple to support all combinations of these options for all the ISDN terminal adapters that are supported. We have attempted to write scripts that work with the most common ISDN configurations. You may have to get a revised script from your Internet service provider or network administrator if your server uses different options. You can also modify a script yourself using the Modem Script Generator or by editing the script text directly.

How to Turn Off or Remove Open Transport/PPP

To disable and remove Open Transport/PPP software by using the Custom Remove option in the Installer, follow these steps:

1. Open the Installer application included with Open Transport/PPP 1.0.1.

The Welcome to the Apple Installer screen appears.

2. Click the Continue button.

The Open Transport PPP Installation screen appears

3. Choose Custom Remove from the pop-up menu in the upper-left corner.

4. In the list that appears, select the files you would like to remove by

..TIL28039-Mac_OS_8-Before_Installing_OT-PPP.pdf

clicking the box next to each file so that an "X" appears in it. To completely remove

Open Transport/PPP, you should select all the files listed.

5. Click the Remove button.

If a window appears asking you whether to quit any open applications, click Continue.

A window will appear telling you to restart your computer.

6. Click the Restart button.

7. Reinstall and configure your previous SLIP/PPP software as required.

To disable Open Transport/PPP without using the Installer, follow these steps:

NOTE: Although the PPP and Modem control panels appear in the Extensions Manager, there is no component in the Extensions Manager that lets you disable Open Transport/PPP. To disable Open Transport/PPP without using the Installer, you must follow the instructions given here.

1. Move the OpenTpt Remote Access, OpenTpt Modem, and OpenTpt Serial Arbitrator shared libraries from the Extensions folder in the active System Folder.

2. Move the PPP Commands file from the Scripting Additions folder in the Extensions folder.

3. Move the PPP and Modem control panels from the Control Panels folder in the active System Folder.

4. Restart your computer.

It is not necessary to move the Modem Scripts folder from the Extensions folder.

TITLE

Mac OS 7.6: Clean Install Instructions

Article ID: 30034
Created: 6/17/97
Modified: 1/19/99

TOPIC

Is there any shortcut for doing a clean system folder install under System 7.6? I would like to do this without having to remove the Finder or System file and renaming the system folder.

DISCUSSION

Purpose of a Clean Installation

A normal system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving all files in place, and forcing the Installer to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It is also useful in troubleshooting.

Clean Install Instructions

Follow these instructions in the order presented.

If you have a Disk Tools Disk:

1. Shut down your Macintosh computer.
2. Insert Disk Tools in the floppy drive, and turn on the computer. At the desktop, the Disk Tools floppy disk's icon should be in the upper-right corner of your screen with your hard drive's icon below it.
3. If the computer ejects the Disk Tools disk, make sure you have an Apple SuperDrive (formerly FDHD) that will read high-density disks and that you are using the appropriate Disk Tools that came with System 7.6.
4. Disk Tools Disk 1 is designed for use with all non-PowerPC machines except those with IDE drives.
5. Disk Tools Disk 2 is designed for use with all machines with IDE drives (LC 630, PowerBook 190, LC 580, Performa 640, etc.), and all PowerPC computers.

If you have an Mac OS 7.6 CD

1. Insert the Apple Macintosh CD in the CD-ROM drive.
2. Restart your Macintosh.
3. Hold down the letter 'C' on the keyboard and turn the computer on. Hold down the key until you see the "Welcome to Macintosh" message.
4. If the computer does not start from the CD, shut down the computer, turn on the computer and immediately hold down the Command-Option-Shift and the large Delete key simultaneously. Hold down these keys until you see the "Welcome to Macintosh" message.
5. At the desktop, the Apple Macintosh CD's icon should be in the upper-right corner of your screen with your hard drive's icon below it. If any other hard drive appears above the Apple Macintosh CD, go to the Control Panels under the Apple Menu, open the Startup Disk item, select the Apple Macintosh CD, close all open windows and restart. The Apple Macintosh CD should then appear above the hard drive.

Run Disk First Aid

1. Disk First Aid can detect and repair problems with a hard disk.
2. Open the Disk Tools disk or the Apple Macintosh CD. Apple Macintosh CD users should open the Utilities or Disk Tools Folder.
3. Double-click on the Disk First Aid icon. Select the main hard drive's icon at the top of the Disk First Aid window.
4. Click on Verify. Disk First Aid will check your hard disk for any potential problems. If it finds a problem, click Repair. It will attempt to fix the problem.
5. Repeat this procedure for each hard disk attached to the system.
6. When you are finished verifying the hard disks, choose Quit from the File menu to return to the desktop.

..TIL30034-Mac_OS_7-6_Clean_Install_Instructions.pdf

If Disk First Aid cannot repair a hard disk, you should back up the hard disk and reinitialize it using the appropriate formatting utility for that drive. For Apple drives, use Apple HD SC Setup or Drive Setup.

Install System 7.6:

From Floppy Disk

This assumes you have started the computer using the Disk Tools diskette.

1. You have finished using the Disk Tools disk so, choose Shut Down from the Special menu. The Disk Tools will automatically eject.
2. Insert the "Install Disk 1" disk into the Macintosh and turn the computer on. The computer will start up using the system file on the Install disk.
3. The "Mac OS 7.6" welcome screen will come up.
4. Follow Step 1 in the Mac OS installer by reading the Read Me file. Click on the document icon, read the file if you have not already, then quit SimpleText and return to the Installer.
5. Follow Step 2 in the Mac OS installer by updating the hard disk driver. Click on the button with 3 stacked drives. This launches Drive Setup or HDSC Setup, depending on which computer you are using. Select your hard drive, then click on the Update Driver button. You will be prompted to quit the application and return to the Installer. (See note)
6. Follow Step 3 in the Mac OS installer by choosing the drive you are installing onto. Click on the drive button. This will prompt you to choose a drive to install onto. Select the appropriate hard drive that has enough room, then click OK.
7. To install the software, click on the Installer button in Step 4 of the Mac OS installer.
8. When the installer window appears, first select the features of 7.6 you wish to install. For further information about these features, refer back to the Read Me file. Then click on the Options button. Select the box next to "Create New System Folder (Clean Installation)" and then click "OK." This will install a new system folder and rename you current folder "Previous System Folder."
9. Insert the other disks when instructed by the Installer.

Note: You cannot update the driver if you are using a non-Apple drive, or if you have used a third-party utility to reformat your drive.

From Mac OS 7.6 CD-ROM

This assumes you have started the computer using the Mac OS 7.6 CD-ROM.

1. Open the Mac OS 7.6 CD icon.
2. Double-click the "Install Mac OS" icon
3. The "Mac OS 7.6" welcome screen will come up.
4. Follow Step 1 in the installer by reading the Read Me file. Click on the document icon, read the file if you have not already, then quit SimpleText and return to the Installer
5. Follow Step 2 in the installer by updating the hard disk driver. Click on the button with 3 stacked drives. This launches Drive Setup or HDSC Setup, depending on which computer you are using. Select your hard drive, then click on the Update Driver button. You will be prompted to quit the application and return to the Installer. (See note)
6. Follow Step 3 in the installer by choosing the drive you are installing onto. Click on the drive button. This will prompt you to choose a drive to install onto. Select the appropriate hard drive that has enough room, then hit OK.
7. To install the software, click on the Installer button in Step 4 of the installer.
8. When the installer window appears, first select the features of Mac OS 7.6 you wish to install. For further information about these features, refer back to the Read Me file. Then click on the Options button. Select the box next to "Create New System Folder (Clean Installation)" and then click "OK." This will install a new system folder and rename you current folder "Previous System Folder."

Note: You cannot update the driver if you are using a non-Apple drive, or if you have used a third-party utility to reformat your drive.

When you are finished with the installation, restart the computer. If you started from the diskette, it will be ejected, however if you started from the CD-ROM you will need to eject the Mac OS 7.6 CD.

After performing a Mac OS 7.6 Clean Install and restarting the computer, "About This Computer" under the Apple Menu will no longer display the specific Macintosh name. Instead, it will display only "Macintosh", "Macintosh Powerbook", or "Power Macintosh" depending on the type of computer it is running on.

Troubleshooting

These steps assume you are using the Clean Install of system software for troubleshooting purposes.

Verify Problem Resolution

After performing a clean installation, verify that you resolved the problem before adding anything to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of performing a clean installation.

Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Previous System Folder") such as fonts, screen savers and device drivers. If possible, you should reinstall these items from their original disks.

..TIL30034-Mac_OS_7-6_Clean_Install_Instructions.pdf

If the original disks are not available, you may move the nonstandard items from the Previous System Folder to the new System Folder. Be careful not to replace anything that is already in the new System Folder. Only move items that are not already in the new System Folder.

- Open each corresponding folder within the System Folder and the Previous System Folder and then compare the contents.
- Move up to 5 items that are not already in the new System Folder and its sub folders from the Previous System Folder and its sub folders.
- Restart your Macintosh.
- Verify that the Macintosh is still starting up properly and that basic functions are working properly.
- Repeat Steps 2-4 until all non-standard items have been moved from the Previous System Folder to the new System Folder.

Final Steps

- Verify your applications are performing normally. If not, refer to the application manual or contact the vendor.
- When the Macintosh behaves as expected and you are sure that all needed items from the Previous System Folder are transferred or reinstalled, move the Previous System Folder to the Trash, and choose Empty Trash from the Special menu.

Mac OS 7.6.1 System Update

If you have the Mac OS 7.6.1 Software update now would be an excellent time to complete the update.

The Mac OS 7.6.1 System Update is available through online services such as America OnLine and Compuserve, and at Apple's Web site at <http://www.apple.com/swupdates>.

Color StyleWriter 4500			
CSW 4000 Series	1.1	Serial	-
CSW 4000 Series (AT)	1.0.3	LocalTalk	-
Color StyleWriter 6500			
CSW 6000 Series	3.1.1	Serial, LocalTalk	-
Notes			
1	Uses GrayShare. Apple's GrayShare technology gives you the ability to print over 130 shades of gray and lets you connect your printer to a network through your Macintosh. Color StyleWriter printers uses ColorShare instead of GrayShare.		
2	LocalTalk requires Color StyleWriter 2400 LocalTalk Module (M3458LL/A).		
3	All GX printer drivers require System 7.5.x, or 7.6.x and QuickDraw GX. You cannot use these drivers without QuickDraw GX installed. QuickDraw GX print drivers are not supported with any version of Mac OS beyond 7.6.x, and are not Mac OS 8 compatible.		
4	These drivers were updated from 1.0 when you install QuickDraw GX v1.1.2		
5	Use the StyleWriter 1200 driver to print from a Power Macintosh with System 7.5.2 to a StyleWriter I or II Printer		
6	LocalTalk requires LocalTalk Module (M4615ZM/A). EtherTalk requires EtherTalk Adapter (M4775LL/A).		
7	Contact GDT Softworks for QuickDraw GX versions of these printer drivers.

LaserWriter 8	8.6.5	LocalTalk, Ethernet	-

Notes	
1	Uses GrayShare. Apple's GrayShare technology gives you the ability to print over 130 shades of gray and lets you connect your printer to a network through your Macintosh. Color StyleWriter printers uses ColorShare instead of GrayShare.
2	Some LaserWriters and LaserWriter Plus printers are not compatible with LaserWriter 7.1.2 and should use the LaserWriter 7.0 or 8.1.1 driver instead.
3	All GX printer drivers require System 7.5.x, or 7.6.x and QuickDraw GX. You cannot use these drivers without QuickDraw GX installed. QuickDraw GX print drivers are not supported with any version of Mac OS beyond 7.6.x, and are not Mac OS 8 compatible.
4	LaserWriter 8.6.1 driver update is posted online. LaserWriter 8.6.5 is only available with Mac OS 8.6.
5	The drivers are updated from 1.0 when you install QuickDraw GX v1.1.2 or newer. This QuickDraw GX driver is bundled with QuickDraw GX--it is not posted to online services separately. To download this driver from online services you must download all of QuickDraw GX.
6	For support of the optional PostScript Fax Card and use of the Fax Phone Book features, use LaserWriter 8.2.3f.
7	The LaserWriter 8.3.4 driver can be helpful when troubleshooting the LaserWriter 12/640 PS printer. However, it is not recommended for daily use. When using this driver, you must use the PPD supplied from the LaserWriter 8.5.1 software.
8	In order to change the printer name or toggle the startup page on the LaserWriter 12/640 PS, you need to use an Ethernet or LocalTalk connection. You cannot use a serial connection to perform these changes.
9	The Personal LaserWriter SC driver is supported on System 7.5.1 and earlier.

Modified: 9/5/97

TOPIC

I just did a clean install of Mac OS 8 on my PowerBook. Now when I go to select Sleep from the Special Menu I only have the choices of Empty Trash, Eject and Shut Down. How do I put the PowerBook to sleep? Did I install Mac OS 8 wrong?

DISCUSSION

You are most likely in Mac OS 8's "Simple Finder" mode. When in this mode you only have access to the essential features and commands.

To change from "Simple Finder" mode, follow these steps:

- Go to the Edit Menu and select Preferences.
- In the Prefrences dialog box uncheck the Simple Finder check box.
- Then close up the Preferences window and Sleep should now be an avaiible selection under the Special Menu.

"Simple Finder" mode will simplify your menu selections down to the following choices:

The Apple Menu will stay the same.

The File Menu will have:

New Folder
Open
Close Window
Duplicate
Find

Edit Menu:

Cut
Copy
Paste
Preferences

View Menu:

as Icons
as Buttons
as List

Special Menu:

Empty Trash
Eject
Shut Down

Help Menu:

About Help
Show Ballons
Help

TITLE

Apple Studio Display (15" LCD): Description

Article ID: 30458
Created: 3/18/98
Modified: 1/12/00

TOPIC

This article contains a description of the Apple Studio Display (15" LCD).

DISCUSSION

The Apple Studio Display combines state-of-the-art digital imaging technology with a number of advanced software-based features unique to Apple. The result is a high-performance flat-panel display that is the ideal choice for virtually anyone who spends a lot of time manipulating text, graphics, and other media on-screen. Whether you are a multimedia content creator, a designer, a writer, an educator, or an accountant, the Apple Studio Display can make your job look a lot better to you and make you look a lot better at your job.

When it comes to on-screen image quality, the Thin Film Transistor Active-Matrix LCD technology used by the Apple Studio Display enables it to offer outstanding brightness, contrast ratio, and sharpness, the factors that combine to provide optimal viewing. It also provides you with an impressively wide (120 degree - horizontal) viewing angle, as well as completely eliminating screen flicker (which many people find not only eliminates eyestrain but also significantly increases their productivity). And, of course, there is that key advantage in terms of work-space efficiency: The Apple Studio Display offers all of this performance in a product that is a fraction the size of a traditional computer monitor.

Probably the most distinguishing feature of this display, though, is the advantage it takes of Apple's outstanding hardware/software integration. In the case of the Apple Studio Display, what this enables is an unmatched combination of "smart features" and superior software controls, which adds up to an extraordinarily flexible, responsive device with which to view your work.

In fact, the Apple Studio Display can help you handle virtually any task efficiently and effectively, making that eight hours per day you spend in front of your computer significantly more productive and surprisingly more pleasant. If you deal primarily with graphics, you will be glad to know that the Apple Studio Display requires no special graphics adapter. If you deal more with multimedia, you will appreciate its built-in connectors for both composite and S-video as well as audio input. And if, like many creative professionals today, what you deal with most frequently is a combination, you will find the Apple Studio Display's ability to shift instantly between graphics and video modes invaluable.

The Apple Studio Display, because when you look at all of its high-performance capabilities, you'll really like what you see.

Features

Spectacular display performance:

- offers outstandingly crisp, clear images using Thin Film Transistor Active-Matrix Liquid Crystal Display technology
- produces a completely distortion-free image without any time-consuming geometric correction
- enables flexible viewing through its wide (120 degree - horizontal) viewing angle
- includes both composite and S-video connectors, so you can easily display full-screen video
- eliminates screen flicker, which reduces eyestrain and enhances productivity

Stunning style and ergonomic excellence:

- features a flat-panel design that takes up a fraction of the space required by a traditional display
- includes tilt-and-swivel, and height adjustments for optimal viewing comfort
- offers an alternate picture-frame stand that can further minimize its desktop footprint
- provides easy access to audio/video connectors and screen-control buttons
- reduces cable clutter through an integrated cable guide
- complies with the strict global TCO 95 standards for low power consumption, low emissions, and recyclability

Outstanding hardware/software integration:

- offers an unmatched combination of "smart" features and superior software user controls

..TIL30458-Apple_Studio_Display_(15_LCD)_Description.pdf

- features smart scaling that provides full-screen, high-quality viewing of graphics and video at varying resolutions
- ensures the best-possible performance regardless of display/graphics card or analog input from CPU, through accurate, easy phase adjustment
- makes it easy to optimize your viewing experience using a unique software-based tool that gives you precise, integrated control over white level, black level, and brightness

TITLE

Apple Studio Display 15-inch LCD: Technical Specifications (Rev. A and B)

Article ID: 30460
Created: 3/18/98
Modified: 1/12/00

TOPIC

This article provides the technical specifications for the original Apple Studio Display, and the Revision B display introduced at the 1999 San Francisco MacWorld.

The specifications for the two displays are virtually identical. Differences specific to the Rev. B display are in a separate section at the bottom of this article.

DISCUSSION

Technical Specifications

Screen size/diagonal viewable image size:

- 15.1 inches (diagonal viewable image size)

Screen type:

- Thin film transistor (TFT) active-matrix liquid crystal display

Display colors

- 16 million (maximum)

Viewing angle (typical):

- 120 degree horizontal; 90 degree vertical

Brightness (typical):

- 180 (cd/m²)

Contrast ratio (typical):

- 200:1

Resolution and screen refresh rates:

- 640 x 480 pixels at 60Hz, 67Hz, 72Hz, or 75Hz
- 720 x 400 pixels at 70Hz
- 800 x 600 pixels at 56Hz, 72Hz, or 75Hz
- 832 x 624 pixels at 75Hz
- 1,024 x 768 pixels at 60Hz, 70Hz, 74.9Hz, or 75Hz

User controls (hardware and software):

- Power on/off
- Graphics/video toggle
- Brightness
- Video source select
- Reset
- On-screen display (OSD) navigation
 - Menu select
 - Position
 - Information (display status)

- Language
- Function adjustment
- Menu off
- o On-screen display functions
 - Tracking (course, fine)
 - Position (vertical, horizontal)
 - White level
 - Black level
 - Sharpness
 - White point

Screen treatment:

- o Antistatic, antireflective coating

Connectors and cables:

- o Input:
 - 15-pin D-sub for RGB video
 - 4-pin DIN for S-video
 - RCA-type connector for composite video
 - RCA-type connectors for audio
 - 6.5mm DC connector for DC input
- o Output:
 - Mini-stereo connector for audio
- Two 4-pin DIN connectors for Apple Desktop Bus

Electrical requirements:

- o Line voltage: 100 to 120 V AC (200 to 240 V DC)
- o Frequency: 50 to 60 Hz, single phase
- o Power: 30 W (operating)

Agency approvals:

- o FCC Part 15 Class B
- o CISPR 22 Class A (EN500821f) - complies with European EMC directive
- o DOC Class B
- o MPR -II
- o VCCI Class 2
- o CE Mark
- o EPA Energy Star compliant
- o IEC 950
- o UL 1950
- o CSA 950
- o EN60950
- o NUTEK
- o TCO '95

Environmental requirements:

- o Operating temperature: 50 degree F (10 degree C) to 95 degree F (35 degree C)
- o Storage temperature: -4 degree F (-20 degree C) to 140 degree F (60 degree C)
- o Operating humidity: 20% to 80%, noncondensing
- o Storage humidity: 5% to 95%, noncondensing
- o Operating altitude: 0 to 10,000 ft. (0 to 3,048 m)
- o Shipping: 0 to 35,000 feet (0 to 10,606 m)

System requirements:

- o Works with Power Macintosh or other Mac OS-based systems with Power PC processors running Mac OS 7.5 or later*
- o Works with Windows 95- and Windows NT-based systems

* Does not work with Macintosh PowerBook 1400, 2300, 3400, or 5300 systems, nor with 680X0 or Power PC-accelerated 680X0 computers

Size and weight:

- o With desktop stand: 15.0 in. (minimum) to 19.3 in. (maximum) by 15.7 in. by 9.8 in. (38.1 cm to 49.0 cm by 39.9 cm by 24.9 cm)
- o With picture-frame stand: 11.6 in. by 15.7 in. by 6.9 in. (29.7 cm by 39.9 cm by 17.5 cm)

- With desktop stand: 10 lbs. (4.5 kg)
- With picture frame stand: 5 lbs. (2.3 kg)

Ordering Information:

Order No: M6356LL/A (azul)

- Apple Display software
- VGA-to-Macintosh adapter
- Power cord and adapter
- Picture-frame stand
- User's manual
- Limited warranty

Order No. M6356LL/B (blue and white)

- Apple Display software
- VGA-to-Macintosh adapter
- Power cord and adapter
- Picture-frame stand
- User's manual
- Limited warranty

For more information about this product, or to find out where to buy Apple products - through a reseller or from the Apple Store - visit <http://www.apple.com> or call 1-800-538-9696 in the US. In Europe please contact your local Assistance Centre.

REV. B STUDIO DISPLAY SPECIFICATIONS

Unless specifically noted below, all Rev. A specifications hold true for the Rev. B display.

Brightness (Typical)

- 200cd/m²

Resolution and screen refresh rates

- 1,024 by 768 pixels at 60Hz, 70Hz, or 75Hz

Connectors and cables

- 15-pin mini D-Sub VGA connector

Power supply electrical requirements

- Power: less than 35W (operating)

System requirements:

- Works with Power Macintosh or other Mac OS-based systems with Power PC processors running Mac OS 8.0 or later*

Size and weight

- With desktop stand: 12 lbs. (5.5 kg)
- With picture frame stand: 7.7 lbs. (3.5 kg)

Apple Studio Display: Differences Between Revisions A and B		
Feature	Apple Studio Display (rev B)	Apple Studio Display (rev A)
Brightness (typical)	200cd/m ²	180/m ²
Resolution and screen rates	1024 x 768 at 60Hz, 70Hz, or 75Hz	1024 x 768 at 60Hz, 70Hz, 74.9Hz, or 75Hz
Connectors and cables	15-pin mini D-Sub VGA connector	15-pin D-sub for RGB video
Power (operating)	less than 35 watts	less than 30 watts
System requirements	Power PC-based Macintosh running Mac OS 8.0 or later	Power PC-based Macintosh running Mac OS 7.5 or later
Weight (with desktop stand)	12 lbs. (5.5 kg)	10 lbs. (4.5 kg)
Weight (with picture frame stand)	7.7 lbs. (3.5 kg)	5 lbs. (2.3 kg)

TITLE

PowerBook G3 Series: System Reset Key Sequence

Article ID: 30539
Created: 5/6/98
Modified: 1/4/00

TOPIC

This article describes the new key sequence used to reset the system.

DISCUSSION

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. To visually identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.

The Macintosh PowerBook G3 Series has a new key sequence to reset the system.

The four key sequence is Shift-Fn (function)- Ctrl (control)-Power.

The first three keys are located in the lower left hand corner of the keyboard. The power button is just above keys F9 and F10.

The PowerBook G3 Series does not have a hardware reset button. This key sequence is its equivalent. This is marked on the back panel of the system.

This key sequence is used to reset the Power Management Unit.

Resetting the machine in this fashion will also reset the PRAM (parameter RAM).

TITLE

PowerBook G3 Series: Read Me

Article ID: 30540
Created: 5/6/98
Modified: 12/21/99

TOPIC

This article contains the Read Me document for the PowerBook G3 Series (M4735)

DISCUSSION

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. To visually identify which type of computer you have, close the display and inspect the display case. A Macintosh PowerBook G3 has a small, six-color Apple logo on the display case. A Macintosh PowerBook G3 Series computer has a large Apple logo on the display case that is not six-colored.

Important Information About Your Macintosh PowerBook Computer

This document provides late-breaking news about your Macintosh PowerBook G3 Series computer. You may want to print this document to keep with the user's manual for your PowerBook.

Important Information About Your Hard Disk's Format

Your computer's hard disk uses a new, improved file format called Mac OS Extended format (sometimes called HFS Plus). Mac OS Extended format has two benefits: it increases the number of files you can store on your hard disk, and it lets your computer work with data more efficiently than previous formats.

Using Norton Utilities

Norton Utilities version 3.5 is not compatible with Mac OS Extended format. When version 3.5.3 or 3.5.2 detects a Mac OS Extended format drive, it will not attempt to repair the drive.

Warning: Norton Utilities versions 3.5.1 and earlier cannot recognize that a hard disk is in Mac OS Extended format. Using Norton Utilities version 3.5.1 or earlier on your hard disk can result in hard disk corruption and loss of all your data.

If you experience problems with your hard disk, Apple Computer recommends using the version of Disk First Aid included on your system software CD. See the Symantec Web site at http://www.symantec.com/techsupp/num/kbase_num.html for more information on Norton Utilities and Mac OS Extended format.

Using Other Hard Disk Utility and Disk Locking Programs

Some other disk utility and disk locking programs are incompatible with Mac OS Extended format. Before you attempt to use a disk utility or disk locking program, make sure the version you have is compatible with Mac OS Extended format. Check the documentation that came with the program or contact the manufacturer or the vendor that supplied the program.

Using SCSI Disk Mode

To use your PowerBook in SCSI disk mode, the computer to which you are connecting your PowerBook must have Mac OS 8.1 or later installed. If the computer has an earlier version of system software, you will not be able to access your PowerBook's hard disk.

Important Information About Your System Software

The system software on your computer and on the PowerBook G3 Series CD is specially designed to work with Macintosh PowerBook

G3 Series computers. The general release of System 8.0 and the System 8.1 Update are not compatible with your PowerBook. (The system software installed on your computer also has the version number 8.1, but it includes components designed only for your PowerBook model. These components are not included in the general release of System 8.1.)

Important Information About Your Battery

Your battery has external indicator LEDs that let you monitor the charge level of your battery. Before the LEDs will report levels correctly, the battery must be fully discharged and recharged to calibrate the battery. After this calibration, the LEDs will report charge levels properly.

Important Information About External CD-ROM Drives

If you are using an external CD-ROM drive to play audio CDs through the line-in jack on your PowerBook, the audio input source will be switched to the expansion bay each time you select a new track. You can use the SoundSource control strip portion to select Sound In again.

Important Information About Computer Sleep

When Using IrDA:

When the IrDA method of infrared (IR) communication is selected in the AppleTalk control panel and AppleTalk is on, the computer will not go to sleep automatically.

When Using a Communications Program:

Many communications programs, such as PPP, Apple Remote Access, or other dial-up programs, monitor the computer's modem port to check for incoming transmissions. This may mean that the PowerBook will not sleep automatically (after the interval set in the PowerBook control panel). Forcing sleep while connected may result in a lost connection or crash. When your computer is using the battery, you may want to quit a communications program whenever you aren't using it to conserve the battery's charge. (See the user's manual that came with your communications program for more information.)

Important Information About Using an External Monitor

Your PowerBook display must be open when using an external monitor because heat from the PowerBook processor is partially dissipated through the keyboard. Closing the display will cause the PowerBook to go to sleep. Macintosh PowerBook G3 Series computers do not support operation with the display closed.

When connecting an AppleVision monitor to the PowerBook, be sure to connect the monitor's ADB cable to the ADB port (on the back panel). This connection is required by the AppleVision software.

When using an Apple 15" Multiscan monitor in simulscan mode, be sure to set the PowerBook display to turn off rather than dim in sleep. If the computer is set to dim, the external display may behave erratically before going to black. To set the display:

1. Open the Energy Saver control panel
2. Click Advanced Settings
3. Check "Turn off the PowerBook display instead of dimming it."

For general information and instructions on using the external monitor, see these Mac OS Help topic areas:

- Monitors (standard settings)
- Sound (for using the sound capabilities built into an AppleVision monitor)

To set up or change most settings for an external monitor, you use the Monitors & Sound control panel.

The PowerBook G3 Series will support the Portrait and Two Page Grayscale Displays only in 256 Colors/Grays mode.

Important Information About Your Expansion Bays

Booting from Expansion Bay devices:

If the system folder on your internal hard drive is invalid and you need to boot from a expansion bay module, be sure the module is inserted prior to booting or restarting your computer. If you insert the module after booting, you will see a blinking question mark.

Floppy Installation:

When installing software with the floppy module in the left bay, you may experience problems recognizing master disks if the software uses copy-protected disks. If your software requires installation from a CD and authorization from a master (key) floppy, put the floppy in the left bay and the CD module in the right prior to beginning the installation process. If the program cannot locate the floppy in the left bay at the time of authorization, you'll need to cancel the authorization process and quit the installer. Eject the CD and remove the module from the right bay, then insert the floppy module and floppy disk. Launching the application will then allow you to complete the authorization process.

DVD/CD Drive and Waking From Sleep:

There is a period of time when waking from sleep that the DVD/CD drive will allow you to manually eject a mounted DVD/CD using the button on the drive tray. This will cause unexpected behavior. Closing the tray will correct the situation.

DVD Disc Won't Mount After Bootable CD:

If you have a DVD-ROM drive in the right expansion bay of your computer and start up the computer with a bootable CD-ROM disc in the drive, but not as the start-up volume, you may not be able to use DVD discs after starting up until you remove the CD-ROM disc and restart the computer. To use the DVD-ROM drive make sure you do not have a bootable CD-ROM disc in the drive when starting the computer unless you are starting up from it. After starting the computer, you may then use both CD-ROM and DVD discs. This is not an issue if you have the PowerBook G3 Series bootable CD in your drive.

Important Information About Infrared Communication

If you experience trouble connecting to other computers or performance degradation when the IRTalk method of infrared (IR) communication is selected, try moving the computers further apart or off-angle to one another.

Important Information About Using a Microphone

To avoid getting feedback when you use a PlainTalk microphone, be sure that the microphone is at least 1 foot away from the computer. Feedback can also be reduced by lowering the system volume in the Sound control strip portion or the Monitors & Sound control panel.

Important Information About PC Cards

PC Card ATA Hard Drives:

Before you can use a PC card ATA hard drive as a bootable device, you must first run Drive Setup to update the driver on the card. Drive Setup is available in the Utilities folder on your hard drive and also on your PowerBook G3 Series CD.

Zoomed Video PC Cards:

When using applications that use a video digitizer component such as Apple Video Player, be sure to insert your Zoomed Video PC Card in the bottom slot prior to launching the application. If the card is inserted after the application is launched, the picture will not be displayed. You will need to quit and relaunch the application for it to display properly.

Important Information About Using the QuickTake Camera

For best results, use the QuickTake Image Access control panel to look at images in the camera and transfer them to your Macintosh. This method is faster and more reliable than using the PhotoFlash program.

Important Information About QuickTime

When using QuickTime to play MPEG movies with either MoviePlayer or Apple Video Player, you may want to change one or more of the following settings to achieve optimum playback.

- If you have more than 16 megabytes (MB) of RAM, reset the disk cache to at least 1 MB in the Memory control panel.
- Hide the Control Strip, using the Control Strip control panel, if you cannot set the disk cache to 1 MB.
- Turn off virtual memory in the Memory control panel.

Changing the disk cache should permit optimum playback. To reset the disk cache and turn off virtual memory, follow these steps:

1. Open the Memory control panel.
2. Use the arrows at the upper-right section of the control panel to set the disk cache to 1 MB or more.
3. Click Off in the virtual memory section of the control panel.
4. Restart the computer.

To hide the Control Strip, follow these steps:

1. Open the Control Strip control panel.
2. Click the Hide button.

To avoid feedback loops or stuck notes when playing MIDI files with Movie Player, turn virtual memory off. For information on how to turn virtual memory on and off, choose Help from the Help menu when the Finder is active. Click the Memory topic area, and then click "How do I use hard disk space as memory?".

Important Information About Virtual Memory

Virtual memory is a feature of the Macintosh that lets you use part of your hard disk as additional memory. Your computer comes with virtual memory turned on. If you are using an application program designed especially for PowerPC-based computers (often called a

"native" application program), turning on virtual memory lets your application use memory more efficiently. If you check the program's Get Info box before and after turning on virtual memory, you'll see that the numbers in the Memory Requirements box change.

For information on how to turn virtual memory on and off, choose Help from the Help menu when the Finder is active. Click the Memory topic area, and then click "How do I use hard disk space as memory?".

To improve performance, you can also install more memory (RAM) in your computer. See the user's manual that came with your computer for more information.

Important Information About the Apple Color StyleWriter 4000 Series

Your PowerBook may "crash" when printing on a Color StyleWriter 4000 series printer (CSW 4100 or 4500) if the version of its driver is 1.0.3 or earlier. To determine the version of the installed driver software, open the Extensions Manager control panel and locate the CSW 4000 Series extension. The version number will be in a column to the right of the extension name. The CSW 4000 Update 1.1 is available on the Apple Software Updates Web site at: <http://www.info.apple.com/swupdates>.

Important Information About Apple Remote Access (ARA) 3.0

The read me file titled "About Mac OS 8.1 Update" contains some incorrect information about ARA 3.0. The ARA 2.1 installer is not included on your hard drive or CD, so there is no danger of installing it over 3.0. Also, the version of Internet Access installed on your hard drive is compatible with ARA 3.0. The problem with the Internet Dialer has been fixed.

Important Information About At Ease 5.0 and Mac OS Extended Format

The disk security feature of At Ease is not compatible with the format of your hard drive. If you use At Ease and need to restrict access to the computer, please use Password Security instead. Future versions of At Ease will be compatible with Mac OS Extended Format.

Important Information About Third Party Applications

Norton Utilities:

Norton Utilities version 3.5 is not compatible with Mac OS Extended format. When version 3.5.3 or 3.5.2 detects a Mac OS Extended format drive, it will not attempt to repair the drive.

Warning: Norton Utilities versions 3.5.1 and earlier cannot recognize that a hard disk is in Mac OS Extended format. Using Norton Utilities version 3.5.1 or earlier on your hard disk can result in hard disk corruption and loss of all your data.

If you experience problems with your hard disk, Apple Computer recommends using the version of Disk First Aid included on your system software CD. See the Symantec Web site at: <http://www.symantec.com/nu/num-hfs.html> for more information on Norton Utilities and Mac OS Extended format.

Now Contact/Up-To-Date:

The Now Up-to-Date & Contact CD includes outdated versions of Apple software. You do not need to install these pieces because the software included on your computer and the PowerBook G3 Series CD is more current.

The Easy Install of Now Up-to-Date & Contact will install items that will overlay your existing menubar items. To avoid this after installing, you can turn off the menubar items in the QuickContact and QuickDay control panels. To avoid this while installing, follow these instructions to do a Custom Install:

1. Double-click "Install Now Up-to-Date & Contact".
2. Click Continue when the installer splash screen appears.
3. Read or print the license agreement then click Continue to accept it.
4. Click Custom.
5. Scroll down until you see "Now Up-to-Date Application" and "Now Contact Application".
6. Press the Shift key while clicking on the two applications.
7. Click Install.

This will install just the applications, not the corresponding control panels and menubar items. If you would like to install additional items, follow the instructions above and select the items from the window.

TITLE

iMac: ClarisWorks Registration Information

Article ID: 30702
Created: 8/18/98
Modified: 9/15/99

TOPIC

When I launch the ClarisWorks that came on my iMac, it asks me to fill out a registration form, but I cannot find a registration number anywhere in the box. Am I missing something?

DISCUSSION

No, there is nothing missing from your iMac box. The registration notice that comes up when you run ClarisWorks is one of the items left behind from its previous development at Claris Corporation and will be removed from Apple's rebranded version, AppleWorks.

The one registration card that came with your iMac is sufficient to register all Apple products included with your computer, including ClarisWorks. Please take a moment to fill it out and mail it in, or follow the instructions on the card to register via the web.

To avoid any further inconvenience, it is recommended that you click the "Never" button in the ClarisWorks registration notice. The registration card produced by this notice has outdated return address information and should not be used as a substitute for the card that came in your iMac box.

TITLE

Macintosh: Printing to a PostScript Printer via IrDA

Article ID: 30707
Created: 8/20/98
Modified: 6/10/99

TOPIC

With the release of LaserWriter printer driver version 8.6, printing over the IrDA communication channel is now possible.

DISCUSSION

First verify your computer supports IrDA by reviewing Article 20928: ["Macintosh Infrared: Is It IrDA Compatible?"](#).

If your computer is equipped with infrared technology that uses the IrDA protocol, you can establish a wireless TCP/IP or AppleTalk connection to a network using an IrDA network access device, or exchange files with another IrDA equipped computer.

Depending on the type of network protocol that you are going to use, choose Infrared Port (IrDA) from the "Connect via" pop-up menu in either the AppleTalk control panel or TCP/IP control panel.

LaserWriter driver, version 8.6, provides IrDA printing capabilities to Macintoshes having IrDA ports, such as the PowerBook G3 and PowerBook G3 Series, PowerBooks 2400 and 3400, iMac, and so on, for printing to PostScript printers having IrDA ports.

This includes the HP LaserJet 5MP and HP LaserJet 6MP, as well other 100% compatible IrDA printers.

LaserWriter 8.6 is included with Mac OS 8.5.

TITLE

V.90 Protocol: Connectivity Discussion

Article ID: 30734
Created: 9/2/98
Modified: 1/22/99

TOPIC

My iMac comes with a 56 kbps capable modem, why should I use a modem script that limits my speed to 33.6 kbps?

DISCUSSION

The iMac modem is the first modem Apple has shipped that supports the new V.90 protocol. Although derived from the competing x2 and K56flex protocols, the V.90 specification is in its infancy and will be undergoing changes over the next several months.

When a modem is attempting to establish a connection with another modem it will attempt to connect at the highest speed possible. The speed of the connection is determined by two factors:

1. The capabilities of the other modem

The remote modem must support the same protocols. The iMac modem supports both V.90 and K56flex protocols so it can connect to other modems that support these protocols at speeds between 33.6 kbps and 53 kbps (although the modem technology is capable of 56 kbps, FCC regulations limit the top speed to 53 kbps). If the remote modem does not support either of these protocols, the iMac modem will then try using the V.34 protocol which has a top speed of 33.6 kbps. The modems will continue to try slower protocols until they find one that both modems are capable of supporting.

2. Quality of the connection:

Modem connections are being made over regular voice telephone lines. The quality of a connection between two points can be different each time the connections is made. Once the modems have negotiated a protocol to use, they test the ability of the connection to sustain the speed of the connection. The higher the speed of the connection, the more susceptible it is to noise on the phone lines. Therefore, even when making a V.90 connection between the same two points, one connection could be 44000 bps while the other could be 38000 bps.

If the quality of the connection is such that it can not support the slowest V.90 connection then the modems will step down to the next protocol.

What we are observing with the iMac modem is this V.90 implementation is overly aggressive. Instead of negotiating down to support a slower but more stable connection, the modem keeps trying to connect at a higher speed. This causes the remote modem to determine that a connection can't be established and it hangs up.

There are times when this aggressive behavior will manage to complete a connection, only to be dropped minutes later since the quality of the phone connection really can not support that connection speed.

The V.34 only modem script is a work around for customers that are unable to connect using the V.90 protocol. In many cases, even if the V.90 implementation negotiated downward properly, the resulting connection might end up being between 28.8 kbps and 33.6 kbps due to phone line quality. In these cases there is no performance difference between using the V.34 and V.90 protocols.

Apple is working with others in the modem industry to improve the behavior of the V.90 implementation. The iMac modem is capable of being upgraded via software.

Currently, modem firmware updates are available from the Apple Software Updates updates page at: <http://asu.info.apple.com>

For additional information on 56 kbps connectivity, see:

iMac Discussion Board: Frequently Asked Questions

Article ID: 30808
Created: 10/15/98
Modified: 12/21/99

TOPIC

This article contains iMac commonly asked questions, and information regarding technical issues that may be encountered with an iMac. If the link to the answer to your question is not here, try using the Tech Info Library Search function, or visit the iMac Discussion Board to find more current information.

Links to TIL Articles regarding the following Frequently Asked Questions (FAQ) included in this article:

- How do I know if my iMac has all the Apple-recommended updates and where can I find these updates?
- I get a flashing question mark displayed on the screen momentarily when the iMac starts up. It goes away but I was wondering why it happens and how to get rid of it.
- My Control Strip moved up near the left center of the screen. How did it get up there? How do I move it back down?
- I am having trouble getting my Epson Color Stylus 600 or Epson Stylus 740 to work with my iMac. What should I do?
- Some of my menu options, such as Sleep, Restart, Get Info, and View Options are no longer listed. What is causing this symptom?
- What type of random-access memory (RAM) and video random-access memory (VRAM) do I need for my iMac?
- How do I upgrade the memory in my iMac?
- Why is there a hole in the I/O door?
- My modem dials automatically. How do I get it to stop?
- How do I change my default browser and e-mail application?
- How do I register the ClarisWorks application that came with my iMac?
- What books do you recommend to learn about the Macintosh computers in general, Mac OS, and iMac?
- My computer starts up with a green light but there is no video.
- Certain CDs make a vibrating noise when used in my iMac. What is causing this noise and how can I eliminate it?
- I just installed memory in my iMac and now I have no sound. What could be causing this symptom?
- I am having some difficulty in connecting to my Internet service provider (ISP). Sometimes I will connect successfully, but the connection is dropped after a few minutes. What can I do to resolve this issue?
- I get intermittent freezes and type xx errors. What should I do?
- What Apple products are compatible with the iMac's Infrared (IR) port and how do I network my PowerBook G3 series computer to the iMac using the IR port?
- I want to know more about connecting my iMac to another infrared capable computer or printer. How do I set it up to share files?

DISCUSSION

Question: How do I know if my iMac has all the Apple-recommended updates and where do I get them if it needs them?

Answer: The iMac revision A and B may need the iMac Firmware Update and iMac update 1.1. The newer revisions do not need them but their presence can be confirmed using the Apple System Profiler.

[TIL Article 58174](#) : "iMac: When to Install Available Updaters"

[TIL Article 24777](#) : "iMac Update 1.1: Misidentified With AppleSystem Profiler 2.1.2"

[TIL Article 58175](#) : "iMac: Confirming Installation of the AppleModem Updater"

The updates are available at Apple Software Updates. See the note at the end of this document.

Question: I get a flashing question mark displayed on the screen momentarily when the iMac starts up. It goes away but I was wondering why it happens and how to get rid of it.

[TIL Article 58042](#) : "iMac: Blinking Question Mark at Startup"

Question: My Control Strip moved up near the left center of the screen. How did it get up there? How do I move it back down?

[TIL Article 60241](#) : "Mac OS: Moving the Control Strip"

..TIL30808-iMac_Discussion_Board_Frequently_Asked_Questions.pdf

Question: I am having trouble getting my Epson Color Stylus 600 or Epson Stylus 740 to work with my iMac. What should I do?

Answer: If you have not done so already, install iMac Update 1.1. The software is available from the Apple Software Updates site.

Also make sure you install the latest iMac/USB driver for your specific printer. You can download the latest Epson drivers from <http://www.epson.com/support/instans/macijans.html>.

Review the recommended Apple software updates suggested by the USB device manufacturer. If you encounter issues with the Epson printing software, remove all the Epson printer software and reinstall the latest software version.

Question: Some of my menu options, such as Sleep, Restart, Get Info, and View Options are no longer listed. What is causing this symptom?

[TIL Article 30157](#): "Mac OS 8: No Sleep Choice in Special Menu"

[TIL Article 43013](#): "iMac: Installing Memory (2 of 2)"

Question: Why is there a hole in the I/O door?

Answer: The hole is for using a finger to open the door.

[TIL Article 58055](#): "iMac: Hole in I/O Door Not For Cables"

Question: My modem dials automatically. How do I get it to stop?

Answer: There are numerous settings to automate a connection to the Internet. Most settings are listed in the following article.

[TIL Article 24877](#): "Modem Dials Automatically"

Question: How do I change my default browser and e-mail application?

Answer: Apple recommends using the Internet control panel.

[TIL Article 58041](#): "iMac: Changing Internet Settings and Applications"

If you choose to use Internet Config instead of the Apple Internet control panel use the latest version of Internet Config. Review the following articles for further tips.

[TIL Article 24679](#): "Mac OS 8.5: Internet Control Panel or Internet Config?"

[TIL Article 24676](#): "Mac OS 8.5: Mac OS Help Crashes With Type 3 Error"

[TIL Article 24736](#): "Sherlock: Internet Config Conflict"

Question: How do I register the ClarisWorks application that came with my iMac?

[TIL Article 30702](#): "iMac: ClarisWorks Registration Information"

Question: What books do you recommend to learn about the Macintosh computers in general, Mac OS, and iMac?

Answer: Your local book store will have many excellent books covering those subjects. Here are a few books recommended by Macintosh users like yourself.

- "The Little Mac Book"
- "Sad Macs, Bombs, and Other Disasters : And What to Do About Them"
- "Beyond the Little Mac Book"
- "The Little iMac Book"
- "The Macintosh Bible (Bible Series)"
- "Mac OS 8.5 for Dummies (For Dummies)"
- "The Complete Idiot's Guide to Macintosh OS 8.5"

..TIL30808-iMac_Discussion_Board_Frequently_Asked_Questions.pdf

- "Mac Answers!"

Here are some iMac-specific titles:

- "The iMac for Dummies"
- "Sam's Teach Yourself iMac in 10 Minutes"
- "The iMac Book "
- "Quick Start Your iMac Training CD - Macintosh (1 of 1) Vol 1"

Question: My computer starts up with a green light but there is no video.

Answer: If you can get to computer to restart with the video install the iMac Firmware Update. If the issue continues or the update has no affect have the computer checked by a local Apple-authorized service provider .

Question: Certain CDs make a vibrating noise when used in my iMac. What is causing this noise and how can I eliminate it?

Answer: It is normal to get a slight vibrating noise with certain CDs when using a high-speed CD-ROM drive like the drive in the iMac. The artwork on a CD-ROM disc may cause the CD's center of gravity to be slightly off center. Because the CD is spinning at such a fast rate, the CD will wobble, which in turn causes a slight vibration. This is perfectly normal and does not damage your computer or CD-ROM drive in any way.

If you are using a CD with a removable, sticky label, remove the label prior to using the CD.

Also install iMac CD Update 2.0. This software update improves the way the CD-ROM drive handles unbalanced CDs. It may reduce the amount of vibration for most CDs.

The software is available from the Apple Software Updates site.

TIL Article 20233: "Macintosh Computers: 8x-Speed (or faster) CD-ROM Drive & Vibration"

Question: I just installed memory in my iMac and now I have no sound. What could be causing this symptom?

Answer: It is possible the audio cable may have been accidentally disconnected or it may not be seated properly. Remove the rear access cover from the computer. You will notice four cables attached to the main logic board. The cable furthest to the left is the audio cable. Make sure it is seated properly. Reseat the cable if necessary. The Mac OS Info center has directions on how to install memory in your computer. Refer to these directions if you need help removing the rear access cover. Step 10 in the directions has a good diagram depicting the audio cable.

TIL Article 58044: "iMac: No Sound or Startup Chime Heard"

Question: I am having some difficulty in connecting to my Internet service provider (ISP). Sometimes I will connect successfully, but the connection is dropped after a few minutes. What can I do to resolve this issue?

TITLE

PowerBook: Printing to an IrDA Printer

Article ID: 30861
Created: 12/8/98
Modified: 12/9/98

TOPIC

How can I print from my IrDA-capable PowerBook to an IrDA laser printer? The Infrared control panel says that it sees the printer. The printer's IRDA light comes on and I have switched AppleTalk over to the IRDA port.

However, in the Chooser, when I click on the laser printer's icon, the printer does not show up on the right hand side. What else do I need to do?

DISCUSSION

Create a new Infrared desktop printer with the Desktop Printer Utility. This utility is located in the Apple LaserWriter Software Folder in the Apple Extras folder. Double-click the Desktop Printer Utility. Choose New from the File Menu. Then select Printer (Infrared) from the window that opens.

Another window open which has a Generic, printer icon. To change to the printer of your choice click on the Change button.

The Printer File window opens displaying a choice of printers. Select your printer from the list and click Select. This window will close and the name of the selected printer will appear in the Untitled window. Choose Save As from the File Menu and save this Printer file as a desktop printer.

The desktop printer icon will appear on the desktop.

TITLE

Remote Access: Modem Not Responding Alert

Article ID: 30893
Created: 1/22/99
Modified: 11/4/99

TOPIC

When Remote Access is not receiving correct responses from the modem (usually, no response at all), the connection attempt will fail with an alert.

Use this troubleshooting path to help identify the source of the failure.

DISCUSSION

Where Open Transport/PPP is installed, substitute "PPP control panel" for "Remote Access control panel" throughout.

1. Reset the modem and check its connections

- a. External modems: Press the modem's reset button if available, or disconnect its power for least 15 seconds. If the modem does not use a separate power cable, it draws power from its connection to the computer. Internal modems: Shut down the computer for at least 15 seconds.
- b. "Check its connections" in the alert refers to the modem's connection to the computer, not the telephone outlet. This is not easily checked for internal modems, but for external modems, check the modem and power cables for secure connections and signs of damage. This is especially important if the symptom is intermittent or can be caused by moving the modem or its cables. If the modem normally provides any visual signs of power, such as illuminated LED's, check for them.

2. Configure the Modem control panel

Configure the Modem control panel to use the modem script appropriate for the modem. Apple-branded internal modems use these scripts, by computer:

- **Power Macintosh G3 (Blue & White):** PowerMac G3 Internal 56K, PowerMac G3 Int56K (v.34 Only)
- **PowerBook G3 Series:** PowerBook G3 Internal 56K, PowerBook G3 Int56K (v.34 Only)
- **iMac:** iMac Internal 56K, iMac Internal 56k (v.34 Only)
- **Power Macintosh G3 & Power Macintosh 6500:** Apple/GV 56K
- **PowerBook 3400 & PowerBook G3:** PowerBook 3400/G3 Internal 33.6
- **Geoport Telecom Adapter (internal or external):** Geoport/Express Modem

3. Configure the Remote Access control panel and test

- a. Open the Remote Access control panel. Enter any name (user ID), password, and telephone number
- b. Click Connect. If the symptom persists, continue to the next step.

4. Configure the Extensions Manager control panel for Mac OS All

- a. Open the Extensions Manager control panel and select whichever Mac OS All set is available from the Selected Set menu. For example: Mac OS 8.6 All, iMac All, and so on.
- b. If the modem requires any of its own extensions (excluding fax or telephony extensions), ensure they are installed and enabled. Enabled extensions show an "x" in the adjacent checkbox. Extensions Manager will ask to duplicate the Mac OS All set before additional extensions can be enabled. Allow it to do so.

Of the modems that shipped with Apple computers, the following require the extensions listed in order to respond:

- **Apple 56K modem (but not Apple/GV 56K modem):** iMac Modem Extension, PowerMac G3 Modem, or PowerBook G3 Series

Modem, depending upon the computer

- **Geoport Telecom Adapter:** Apple Telecom Modem, Express Modem Tool, Geoport for Power Macintosh, Geoport Telecom Adapter, Geoport Serial Driver, Serial Extension (PM 6100/7100/8100 only), Shared Library Manager, Shared Library Manager PPC, and the Express Modem control panel

- **PowerBook 3400/G3 Internal Modem/Ethernet 33.6 card:** PowerBook 3400 Ethernet extension and PowerBook 3400 Modem extension, or just the PowerBook 3400/G3 Modem extension

c. Close Extensions Manager and restart the computer. Any extensions that may have captured the modem port for their own use are disabled and will remain so until re-enabled in Extensions Manager.

d. After restarting, open the Remote Access control panel and click Connect. If the symptom does not recur, perform extensions troubleshooting to isolate the extensions responsible for the issue. It may only be necessary to correctly configure the software that used them

5. Reset Parameter RAM

a. Select Restart from the Special menu, then immediately press Option-Command-P-R (four keyboard keys, all pressed together), keeping them pressed until the computer chimes or restarts twice. It will not work if the Caps Lock key is depressed, and may not work with non-Apple keyboards.

b. Open the Remote Access control panel and click Connect. If the symptom does not recur, it indicates that there was a conflicting setting in Parameter RAM, probably created by one or more of the disabled extensions, either because it was involved in a system crash, is in conflict with other extensions or with the Mac OS, or was not configured correctly. Perform extensions troubleshooting, but the fault may not immediately or ever return, even after re-enabling the extensions.

6. Trash preferences

Damaged Remote Access preferences may be at fault. This is unlikely given the symptom, but easy enough to confirm prior to the more time-consuming tasks ahead.

a. Move these preference files to the desktop:

- System Folder : Preferences : **Modem Preferences**

- System Folder : Preferences : Remote Access : **Remote Access Connections**

Open Transport/PPP users:

- System Folder : Preferences : **Modem Preferences**

- System Folder : Preferences : **PPP Preferences**

b. Repeat steps 2 & 3 to reconfigure the control panels and test. If the symptom persists, the preferences were not at fault. If you wish to reclaim the configuration information they contained, move them back to their original locations and allow them to replace the newer preference files.

7. Reinstall the modem software, if applicable

Many modems today don't require specific software in order to function for a data connection. Where such software is needed, it is usually for faxing or telephony (using the modem for voice calls). Rarely, a modem might require an extension to enable data compression and error correction (as with some Global Village Teleport Bronze modems, for example). But for this symptom, we're only concerned with software that is required to enable even the barest functionality.

a. If the modem requires such software and the modem never worked reliably, either with this computer or the version of Mac OS in use, check with the manufacturer for a compatible version. Users of Geoport Telecom Adapters, for example, commonly install older, incompatible versions of Apple Telecom that either came with the adapter or with the previous version of Mac OS that was installed.

b. If the modem requires such software and the modem was working successfully before, the software may be damaged. Reinstall the modem software. For Apple modems, this is more likely to affect Geoport Telecom Adapters, for which the software required is abundant. For other Apple modems, continue to the next step.

8. Perform a Clean Install or Clean Restore

The Mac OS may be damaged.

a. Perform a clean install or clean restore of the operating system. If there is any connectivity or modem software to be installed separately, do so immediately afterward.

b. Repeat steps 2 and 3 to retest. If the issue still exists, there is likely a hardware problem requiring service. If you are using an external modem, the problem may be further isolated between the computer and modem by testing the modem on another computer, or confirming that other devices will work on the modem port of this computer.

In many modem troubleshooting calls the customer has only one phone line, and you (the support person) are talking with the customer on that line. So how can you troubleshoot when the line is in use? Here's how:

A "modem not responding" error occurs **before** the modem dials. If the issue is resolved, you will hear the modem attempt to take over the line, then the customer will get a "no dial tone" error. If the issue persists, the "modem not responding" error will persist.

No need to hang up so the customer can try a fix, then get a callback from the customer, then hang up again so the customer can try something else, and so on.

TITLE

Mac OS: Extensions Troubleshooting/Extensions Manager
Features

Article ID: 30929
Created: 3/29/99
Modified: 1/12/00

TOPIC

This article explains the functionality of the Extensions Manager and how to troubleshoot your extensions. The troubleshooting section is at the end of this article.

DISCUSSION

History

The Extensions Manager first made its appearance in the Mac OS in System 7.5. It simplified the way Macintosh users determined what INITs were conflicting with other INITs. In Mac OS 7.6, the Extensions Manager went through a major update and is what we still use today.

What Is Extensions Troubleshooting?

Troubleshooting Extensions is process of trial and error. This process will require you to restart multiple times, which does not harm your Macintosh computer.

How Do I Know if I Have an Extensions Conflict?

If you can startup with the system extensions (Mac OS 8.x All) and your problem does not recur, then you have got an extensions conflict. If you still have the problem using the set Mac OS 8.x All, you should perform a clean installation of your system software.

Is Disabling All the Extensions in the Extensions Manager the Same as Pressing the Shift Key at Startup?

Not quite, see: Tech Info Library Article 17392: "[Extensions Manager: Extensions Off Compared To Shift Down](#)"

EXTENSIONS MANAGER FEATURES

What Are Sets?

A set consists of Extensions, Control Panels, System Extensions, Startup Items and Shutdown Items. The Selected Set displays the name of the current extensions set.

Mac OS 8.x All and Mac OS 8.x Base are locked sets supplied by Apple. These are known-good extension sets, and you have to duplicate these sets to modify them. My Settings is a generic name for a set that has not been named.

View Menu

While you're in the Extensions Manager, open the View Menu. You have more options than just viewing as Folders. Try "View by Packages", you can turn on and off entire software packages with a single click (very useful in troubleshooting extensions). View by Items is one big list of all your Extensions, Control Panels, Startup and Shutdown Items (similar to the Extensions Manager in System 7).

Opening Extensions Manager at Startup

Before the first extension displays at startup, hold down the Space Bar to bring up the Extensions Manager. The changes you make reflect this startup so you do not have to restart again. You have all the same options here as you do in the Finder, most of them in the Selected Set pop-up window.

Press Command and Option keys, close the window and you will restart.

Can I Backup My Extension List?

Not exactly, you can save a list to a SimpleText document from the File Menu. You also can create a report using Apple System Profiler, as well as other useful system information. Also, you cannot import sets.

Identifying Extensions

Be sure to check the Show Item Information section. Information provided there depends on what the vendor wrote into the extension. You can also Get Info in the Edit menu while in the Extensions Manager.

What are the Extensions and Extensions (Disabled) Folders?

In your System Folder, there are Extensions and Extensions (Disabled) folders, setup by the Extensions Manager. They are created if they are not found in the System Folder. When you close the Extensions Manager, all the changes you made are moved by the Finder to the appropriate folder. For example, you disable an extension in the Extensions Manager. Once you quit, the item is moved from the Extensions folder to the Extensions (Disabled) folder.

Troubleshooting Extensions

First, save the current set that has the problem. Next switch to Mac OS 8.x All or Base and restart. If the problem still persists, try disabling the extensions by restarting and pressing the Shift key. If that does not do it, then perform a clean installation of your system software.

Duplicate Mac OS 8.x Set and name it something like "Troubleshooting" or "Test." Using the problem set you saved, determine which extensions from that set are different from our Troubleshooting set. Turn on 3 to 5 of those items while in the Troubleshooting set and restart. Continue this process of turning on items and restarting until the problem reoccurs. You can also turn on a Package at a time, if you choose to View as Packages.

Once the problem occurs, you know that it was one of the last few items you turned on. So start turning off the last group one at a time until you determine which it is.

Once you determine the problem extension, check for version incompatibilities with other extensions or the Mac OS. If you have determined that they are compatible, then try removing and reinstalling the software used to install the extension.

Remember to run a disk repair utility, such as Disk First Aid. If you reinstall a software package, remember to remove the preferences, for that software package, from the Preference Folder. Just drag the preferences to the Trash and empty the Trash.

If you are still having problems, contact the vendor for further assistance.

TITLE

PowerBook G3 Series (Bronze Keyboard): Mold Lines in Plastic

Article ID: 31053
Created: 7/16/99
Modified: 12/21/99

TOPIC

*** RESTRICTED: Apple Internal and Support Providers Only ***
Not For General Public Release

The PowerBook G3 Series (Bronze keyboard) has mold lines in the plastic. Is this normal?

DISCUSSION

Mold lines will appear during the manufacturing process. On the PowerBook G3 Series (Bronze keyboard), these lines are faintly visible on the top case between the keyboard and trackpad, and between the trackpad and trackpad button.

These mold lines are normal, and the unit does not need to be repaired.

Mac OS 8: Claris Emailer Lite 1.1v4 and Sending Compressed Files

TOPIC

I received Emailer Lite 1.1v4 as part of Mac OS 8 internet access. I am unable to send compressed enclosures (the default setting).

DISCUSSION

Unlike the stand alone Claris Emailer-Lite Installer 1.1v3, the Installer inside IAFIT in Mac OS 8 omits the "File Transfer Tools" file.

You will need to manually install Aladdin's DropStuff w/EE 4.0. The Installer for this software can be found following this path on your Mac OS 8 System:

- Internet folder
- Internet Utilities folder
- Aladdin folder
- DropStuff w/EE 4.0 Installer

TITLE

iMac: About Memory, DRAM and Video Memory
Configurations

Article ID: 43011
Created: 7/29/98
Modified: 1/15/99

TOPIC

This article explains iMac Memory, including DRAM configurations and Video Memory Configurations.

DISCUSSION

(This information is gleaned from the Info Center online help system, which is located on your computer's hard disk.)

About Memory

Your computer contains two types of memory: dynamic random-access memory (DRAM) and video memory. You can add DRAM or video memory to your computer in packages called Dual Inline Memory Modules, or DIMMs.

DRAM Configurations

You can increase your computer's DRAM up to 128 megabytes (the revision /A iMac) or 256 megabytes (the revision /B iMac and the 266 megahertz iMac) by adding Dual Inline Memory Modules (DIMMs) to the 2 RAM DIMM slots on the main logic board. For more information about the type of DIMM you must use, see Memory Technical Specifications.

Note: Although revision /A iMac computers may work with larger capacity SO-DIMM's than stated, these larger sizes weren't available for official testing at the time of product development, and so therefore aren't included.

Important: This computer uses Synchronous Dynamic Random-Access Memory (SDRAM) DIMMs. DIMMs from older Macintosh computers are not compatible with your computer and should not be used even though they may fit into the RAM DIMM slots.

There are two slots where memory can be added--an upper slot and a lower slot. You should install memory only in the upper slot. To add additional memory in the lower slot, you must have an Apple-authorized dealer install the memory.

Video Memory Configurations

Your computer comes with 2 MB of video memory built into the logic board and a video memory expansion slot that allows you to expand video memory up to 6 MB. You may want to add more video memory for better performance on applications that use 3D graphics.

The expansion slot accepts a 2 MB or 4 MB Synchronous Graphic RAM (SGRAM) SO-DIMM. For more information about the type of DIMM you must use, see the article on Memory Technical Specifications.

Important: Use only SGRAM SO-DIMMs.

TITLE

iMac: Installing Memory (1 of 2)

Article ID: 43012
Created: 7/29/98
Modified: 11/1/99

TOPIC

This article is the first of two parts describing the specific process for installing memory in your iMac.

For more information on the type of memory used to upgrade your iMac, read TIL article 58007:
"iMac: Type of Memory to Order to Upgrade RAM and VRAM".

For information on upgrading memory on an iMac (Slot Loading), refer to TIL article 58466:
"iMac (Slot Loading): Memory Upgrades".

DISCUSSION

Installing Memory in Your Computer

Important: Before you add memory, print these instructions. You won't be able to view this information, because you must turn off your computer to install additional memory.

Installing memory involves four procedures:

1. Turning off the computer.
2. Opening the computer.
3. Inserting the memory module into a specific slot.
4. Closing the computer.

Warning: Apple Computer recommends that you have an Apple-certified technician install memory. Apple does not provide telephone support for memory upgrades. Consult the service and support information that came with your computer for instructions on how to contact an Apple-authorized service provider or Apple for service. If you install these items yourself, you risk damaging your equipment, and this damage is not covered by the limited warranty on your computer. See an Apple-authorized dealer or service provider for additional information about this or any other warranty question.

Follow these instructions to install memory. Before installing memory, carefully read the "DRAM Configurations" and "Video Memory Configurations" sections above.

Note: Do not use a powered screwdriver. You may damage the screws on your computer.

1. If your computer is turned on, turn it off by choosing Shut Down from the Special menu.
2. Unplug all the cables from the computer, including the power cord.

Warning: If your internal modem is connected to a telephone line, make sure you disconnect the telephone line from the internal modem port before you open the computer's cover. This prevents electric shock.

3. If the computer is secured, unlock it by removing the security cable from the handle.
4. Place a soft towel or cloth on the desk or surface.
5. Holding the handle with one hand and the front of the computer with the other, slowly lift up and turn the computer so the screen is facing

down on the cloth.

6. Use a Phillips screwdriver to unscrew the screw on the lower back cover.

7. Grab the small plastic handle on the cover and pull the cover away from the computer.

8. Set the cover aside.

9. Touch any exposed metal on the logic board/drive assembly. This helps protect the computer from damage caused by electrostatic discharge.

Important: Always do this before you touch any parts, or install any components, inside the computer. To avoid generating static electricity, do not walk around the room until you have completed the installation of the memory and closed the computer.

10. If your computer has clamps over any cables, release the cables underneath the clamp. If the clamp has a screw, unscrew it first, then release the cable.

11. Disconnect the four cables connected to the main logic board. Note: You may need to use a screwdriver to disconnect the video cable.

12. Move the cables aside so they are out of your way.

13. Use a Phillips screwdriver to unscrew the two screws inside the plastic handle.

14. With one hand on the plastic handle, gently pull the handle straight up and out of the computer.

15. Lay the logic board/drive assembly on a clean surface.

This procedure is continued in [iMac: Installing Memory \(2 of 2\)](#)

TITLE

iMac: Installing Memory (2 of 2)

Article ID: 43013
Created: 7/29/98
Modified: 6/17/99

TOPIC

This is part two of a two part article explaining how to install memory in your iMac.

DISCUSSION

(This information is gleaned from the Info Center online help system, which is located on your computer's hard disk.)

(Note: The first half of this procedure is covered in TIL Article 43012: [iMac: Installing Memory \(1 of 2\)](#)

16. If you moved around the room at all, you may have generated some static electricity. Touch any exposed metal on the logic board/drive assembly. This helps protect the computer from damage caused by electrostatic discharge.

17. Carefully snap off the metal shield by lifting both sides.

18. To install a DRAM DIMM, align it in the DRAM slot and push the DIMM down until it snaps into place.

Important: Do not touch the DIMM's edge connectors. Handle the DIMM only by the other edges. The SO-DIMM is designed to fit into the slot only one way. Align the notch in the DIMM with the small rib in the slot and insert the DIMM at an angle. Snap the DIMM into place by pushing down on it until it is lying flat and parallel to the main logic board. Your DIMM's shape and components may vary.

19. Snap the metal shield back into place.

20. To install video memory, place the SO-DIMM in the slot.

21. With one hand on the plastic handle, gently lower the logic board/drive assembly straight down into the computer until it is in place.

22. Use a Phillips screwdriver to screw the two screws back inside the plastic handle.

23. Reconnect the four cables. Note: You may need to use a screwdriver to reconnect the video cable.

24. If your computer has clamps over any cables, tuck the cables underneath the clamp. If the clamp has a screw, replace the clamp over the cable, then screw the clamp into place.

25. Replace the plastic cover. Make sure you snap it back into place around all of the edges. Note: If the cover doesn't fit properly, check the cable connections to make sure the cables are layered properly.

26. Use a Phillips-head screwdriver to screw the screw back on the lower back cover.

27. If you locked the back cover, place the security cable through the handle and lock the cover.

28. Reconnect the cables and power cord you disconnected from your computer and turn on the computer. If you need help reconnecting your cables, see the setup instructions that came with your computer.

Warning: Never turn on your computer unless all of its internal and external parts are in place. Operating the computer when it is open or missing parts can be dangerous and damage your computer.

TITLE

iMac and iBook: Connecting to a 10/100Base-T Ethernet Network

Article ID: 43021
Created: 7/30/98
Modified: 12/21/99

TOPIC

This article provides information on connecting your iMac or iBook to a 10/100Base-T Ethernet network.

DISCUSSION

To connect your computer to an Ethernet network that uses twisted-pair cable, follow these steps:

Note: The hardware connection requires a twisted-pair cable with an RJ-45 connector, which looks like a wide version of a standard telephone connector. Take care to use the correct cable.

1. Plug one end of the RJ-45 twisted-pair cable into the 10/100Base-T Ethernet port on your computer.
2. Plug the other end of the twisted-pair cable into an RJ-45 network outlet. In a small home network, you may be plugging directly into the Ethernet hub. In a larger office network, you will likely plug the cable into an RJ-45 jack in the wall.

You should now have access to other devices such as printers and file servers on the network. If you are connecting to a 100Base-T network, you must use Category-5, otherwise known as Cat-5, cable.

TIL article 43022: "[Creating a Small Ethernet Network in Your Home or Office](#)" has additional details on creating a small network.

TITLE

Creating a Small Ethernet Network in Your Home or Office

Article ID: 43022
Created: 7/30/98
Modified: 12/14/99

TOPIC

This article gives some general advice on how to create a small Ethernet network in your home or office.

DISCUSSION

If you don't have access to an established Ethernet network, you can create a small Ethernet network between several computers. This is useful if you have one or more computers at your home or office and want to transfer information between them, or share a printer or DSL (Digital Subscriber Line). And, with an AirPort Base Station, all users on the Ethernet network get access to the Internet.

Setting up the network

To set up a small Ethernet network, you need an Ethernet hub, which is a device that has multiple Ethernet ports. You can purchase an Ethernet hub at an Apple-authorized retailer or electronics retailer.

The built-in Ethernet capabilities of your computer allow you to connect to any standard Ethernet network using 10/100Base-T twisted-pair cables, thin or thick coaxial cables, fiber optic media, or other standard Ethernet cables.

You can connect directly to an Ethernet network that uses 10/100Base-T twisted-pair cable. The use of other cables will require a special transceiver, available from the network vendor or an electronics retailer.

Note: Do not confuse the Ethernet port with the modem port. Though they look similar, connecting a phone line to the Ethernet port may cause damage to the phone or computer.

Configuring Your Network Connection

After you physically connect your computer to an Ethernet network, you need to configure the software for your network connection. You use either the AppleTalk control panel or the TCP/IP control panel, or both.

Use the AppleTalk control panel to set up your connection to an AppleTalk network (that is, a network using the AppleTalk protocol). Use the TCP/IP control panel to set up your connection to the Internet and to a TCP/IP network. TCP/IP stands for Transmission Control Protocol/Internet Protocol, a standard system for connections between computers of different types, as well as the Internet.

For help with setting up and using your AppleTalk and TCP/IP control panels, see Mac OS Help.

You may need additional information about the network to which your computer is connected, or about the service through which your computer is connected to the Internet, to configure these control panels properly. To get this information, you may need to contact your network administrator or your Internet service provider.

TITLE

iMac: Where Can I Get a Floppy Drive?

Article ID: 43028
Created: 7/30/98
Modified: 11/18/99

TOPIC

Since the iMac does not come with a floppy disk drive built-in, is there a external floppy drive available? Are there other removable media drives, such as Zip or external hard disk drives available?

While this article specifically mentions the iMac, the information is relevant for any Power Macintosh computer which uses USB.

DISCUSSION

Yes, there are a number of third-party companies providing a number of low cost floppy drives, removable media drives, and external hard disk drives.

All of these products will connect to your iMac via the new industry standard Universal Serial Bus, or USB for short. USB is a peripheral bus standard that allows you to connect a variety of peripheral devices to your computer. Many Macintosh computers use Small Computer Standard Interface (SCSI), Apple Desktop Bus (ADB), and serial connections to connect peripheral devices. USB will eventually replace these standards.

Here are a few of the products already announced:

The Imation SuperDisk USB Drive, which reads both 1.44 MB and 120 MB disks. Further information available at:
<http://www.imation.com/>

The Iomega 100 MB Zip Drive. Further information available at: <http://www.iomega.com/>

LaCie external 2, 4 and 8 Gigabyte hard disk drives and an external DVD-ROM drive. Further information available at:
<http://www.lacie.com/>

VST Technologies FireWire Full Height Zip250 Drive, FireWire Zip100. Further information available at:
<http://www.vsttech.com>

For further information, please refer to the following Tech Info Library articles which address many USB Frequently Asked Questions or visit Apple's USB page at: <http://www.apple.com/usb/>

Related articles on connecting older peripherals to iMacs:

- [Article 43028: iMac: Where Can I Get a Floppy Drive?](#)
- [Article 43027: iMac: Can I Connect My Serial Printer?](#)
- [Article 43025: iMac: Can I Use My Old Joystick?](#)
- [Article 43026: iMac: Can I Use My External SCSI Hard Disk?](#)

Additional information on USB:

USB is a multi-platform standard. You can use any USB device that is developed for use with the Mac OS. Check for the Mac OS logo on the USB product packaging, which tells you that the USB product will work with Macintosh computers.

Manufacturers of USB devices for personal computers that do not use the Mac OS may offer software you can install on your computer so that you can use their USB device with your Mac OS computer. For more information, contact the device's manufacturer. For the latest information on USB in Apple products, visit: <http://www.apple.com/usb/>

iMac and iBook: How to Backup Hard Drive Contents

Article ID: 43031
Created: 7/31/98
Modified: 1/13/00

TOPIC

This article suggests some approaches on how to back up your hard disk drive.

DISCUSSION

iMac and iBook feature Universal Serial Bus (USB) ports that make it easy to attach the kind of mass-storage devices that are ideal for backing up the larger hard drives in today's personal computers.

For example, let's say you're using a mere 10 percent of your hard drive--400 MB--for data or applications you need to back up regularly. As an alternative to backing up to floppy disks, you could reach for a single SyQuest SparQ disk--each holds up to 1 GB. Or four Iomega Zip disks--each holds up to 100 MB. Or four Imation SuperDisks--each holds up to 120 MB.

There are also network solutions. If you're connected to a network, you can use products such as Retrospect from Dantz Development to back up your files--to a large volume on the network, a DAT drive, or some other media--and you don't even have to be at your computer when it gets backed up.

Finally, you can arrange for your hard drive to be backed up right over the Internet, including Apple's iDisk:

iDisk: <http://www.apple.com/itools/>
BackJack Internet Backup Service: <http://www.backjack.com>
iMacbackup.com: <http://www.iMacbackup.com/>
Aladdin Systems: <http://www.aladdinsys.com/freedrive/index.html>

To see some of the USB storage devices, and other USB devices, refer to: <http://www.apple.com/usb>

To read about Retrospect: <http://www.dantz.com>

For further thoughts on what to do about a substitute for a floppy drive, read the following Tech Info Library article:

TITLE

Troubleshooting Handbook: Reinstalling Your Computer's Software

Article ID: 43033
Created: 8/5/98
Modified: 3/18/99

TOPIC

Reinstalling Your Computer's Software is part one of chapter 4: Reinstalling Your Computer's Software of the Troubleshooting Handbook.

DISCUSSION

Reinstalling Your Computer's Software

If you are having problems with the system software or applications that came with your computer, you can replace software in the following ways:

- reinstall system software-if you encounter system software problems or you want to add or remove system software components
- reinstall individual applications-if you inadvertently erased an application on your hard disk, are having problems with an application, or an application is damaged
- restore your hard disk with its original contents-if you want your computer to have its original system software, factory settings, and applications that came with the computer

Reinstalling System Software

The Mac OS Install application, located on the software install CD, lets you reinstall the Mac OS (or specific components of the Mac OS) on your computer. This CD also includes a Read Me document that describes how to reinstall custom system software settings and application software that came with your computer.

Before Installing System Software

Before you begin the installation, do the following:

- Customized preferences and settings: If you have preferences or settings in control panels and individual applications, make a note of them so you can easily reset them if necessary, after you install system software.

Note: If you are having problems with your computer, you may not be able to open any files with preferences or customized settings.

- Software that runs in the background: If you are using software that runs in the background, such as virus protection software or access control software, you may need to turn it off before you reinstall system software. For instructions, see the documentation that came with the software.
- If you are installing the Mac OS on a PowerBook: Plug the PowerBook in, open the Energy Saver control panel, and set the PowerBook so it doesn't go to sleep. Turn off password protection in the Password Security control panel.

Important It is highly recommended that you back up the data on your hard disk before installing system software. Apple is not responsible for any lost data.

Using the Installer

Note: If something goes wrong, see Article 43035: "[Problems During Installation.](#)"

1. Start up from the software install CD-ROM disc.
2. Double-click the Mac OS Install icon.

A Welcome screen describes the steps in the installation process.

3. When you're ready to begin, click Continue.

The Mac OS Install application guides you through the steps necessary to install the software. For help during installation, click the Help button in the upper-right corner of the window. If you encounter problems, see Article 43035: ["Problems During Installation."](#)

4. To perform a clean installation, skip to Article 43034: ["Performing a Clean Installation"](#). Otherwise, continue with the following step.

In a clean installation, the Installer creates a new System Folder on your hard disk. Performing a clean installation can be a complicated and lengthy procedure, but if you are experiencing problems or your computer seems slow, it may help.

5. Choose the destination disk from the pop-up menu and click Select.

A dialog box appears asking if you want to reinstall or add/remove software.

6. Do one of the following:

- To install all the software you need for your computer, click Reinstall and follow the onscreen instructions. This is the best choice to solve system software problems.
- To add or remove specific system software components, click Add/Remove. Proceed to the next section, "Custom Installation."

Selecting Which Software to Install

After selecting a disk, you need to decide between a standard or a custom installation. The standard installation installs all the software you need for your model of computer and is the best choice to solve system software problems. A custom installation lets you add or remove specific system software components.

Note: Keep in mind that the more components you install, the more memory, or RAM, is used and the greater the potential for software conflicts. Install only the items you expect to use.

Standard installation: Click Reinstall. Proceed to "Standard Installation" below.

If necessary, use the pop-up menu to choose another destination disk.

Custom installation: Click Add/Remove. Proceed to "Custom Installation" below.

Custom Installation

1. In the window that appears, select the software to install, the software to remove, or both.
2. To install or remove specific items within a component, open the "Installation mode" pop-up menu and choose Customized Installation, or Customized Removal.

The Recommended Installation option installs all items within the software component.

3. If you choose Customized Installation or Customized Removal, a list of the available items within the software component appears. Select the items you want to install or remove. Click the triangle on the left to see individual features within each item. To get information about an item, click the box in the right column with the letter i in it.

4 Repeat steps 1-3 for each software component you want to install.

5. When you're finished, click Start. If you see messages about problems with your hard disk, see Article 43035: ["Problems During Installation"](#)

6. When a message appears saying that the installation process finished, click Quit to close the program or click Continue to install or remove other software.

TITLE

Troubleshooting Handbook: Performing a Clean Installation

Article ID: 43034
Created: 8/5/98
Modified: 7/29/99

TOPIC

Performing A Clean Installation is part two of Chapter 4: Reinstalling Your Computer's Software, part of the Troubleshooting Handbook.

DISCUSSION

Performing a Clean Installation

This section provides instructions for what is commonly called a clean installation of system software. A normal system software installation replaces changed system files and adds new ones, but leaves other files alone. When you install system software using a clean installation, the Installer creates a new System Folder on your hard disk. The old System Folder is renamed Previous System Folder.

Note: Performing a clean installation does not erase the contents of your hard disk. Performing a clean installation can be a complicated and lengthy procedure, but if you are experiencing problems or your computer seems slow, it may help.

After you do a clean installation, your computer has a new System Folder. Once you make sure your computer is working properly, you'll need to reinstall any non-Apple extensions, fonts, and control panels. If your computer came with software that was already installed, some of those programs may need to be reinstalled after you perform a clean installation, particularly if those programs rely on files that used to be in the System Folder. For more information, see "Reinstalling Individual Applications" on page 41.

1. Write down your Internet settings (from the Modem, TCP/IP, and Remote Access control panels).

You'll need to enter these settings in the control panels once the clean installation is finished.

2. Make sure the Caps Lock key is not engaged.
3. Start up your computer from the software install CD.

(See Chapter 2, "Starting Up From a CD")

4. Double-click the Mac OS Install icon to open the Installer.

5. In the Welcome dialog box, click Continue.

The Select Destination dialog box appears.

6. Click the Options button.
7. Click the Perform Clean Installation checkbox to select it, then click OK.
8. Select the destination hard disk, then click the Select button.
9. Click Start to begin the installation.

If you want to customize your installation, click Add/Remove after selecting the destination disk, and see Article 43033: "[Custom Installation](#)"

A new System Folder is installed on your hard disk. (The old System Folder is renamed Previous System Folder.)

10 When the Mac OS Install is finished, restart your computer to make sure it's working properly.

11 Reinstall extensions, fonts, control panels, and other items not installed with the Mac OS from their original disks.

If you don't have the original disks, you can drag these items one at a time from the Previous System Folder to the new System Folder. To make sure the software is compatible with this version of the Mac OS, restart your computer after you reinstall each item.

12. After you're sure that you've copied all the items you want to save into your new System Folder, delete the Previous System Folder from your hard disk.

If the Clean Installation Didn't Solve the Problem

You may want to revert to the Previous System Folder so that you do not have to reinstall your custom extensions, fonts, control panels, and other items not installed with Mac OS 8.

To use the previous system again, follow the steps in this section.

1. Locate the active System Folder. It has the Mac OS icon on it.
2. Open the System Folder and move the System file into the Preferences folder. Close the System Folder.
3. Rename the System Folder "Clean System Folder."
4. Rename the Previous System Folder (the one you wish to use again) "System Folder."
5. Open the newly designated System Folder and double-click the System file. Close the window that appears, then close the System Folder. The Mac OS icon should appear on the System Folder's icon.
6. Restart your computer.
7. Once you are sure your computer is working properly, drag the Clean System Folder to the Trash.

If this doesn't work, you may have a hardware problem. Consult an Apple-authorized service provider.

Warning This procedure may not work. If it does not, you will have to perform a clean installation again.

TITLE

Troubleshooting Handbook: Problems During Installation

Article ID: 43035
Created: 8/5/98
Modified: 3/18/99

TOPIC

Problems During Installation is the third part of Chapter 4: Reinstalling Your Computer's Software, of the Troubleshooting Handbook.

DISCUSSION

Problems During Installation

This section helps you solve problems you may encounter while installing your software.

You can't start up the computer using the software install CD.

Your computer located the system software on your hard disk before it located the system software on the CD. If you have an external hard disk with system software, the computer may locate and start up from that device instead of the CD.

Or, with the CD inserted, open the Startup Disk control panel and click the CD icon.

Then restart the computer. After you install the software, use the Startup Disk control panel to reselect your hard disk, then restart your computer.

An error message appears saying installation couldn't occur.

If a message says installation could not occur because a file is open, quit all programs. If file sharing is on, turn it off. Then try installing again.

- Restart your computer with virtual memory turned off. To do this, either restart your computer from the software install CD or hold down the Command key until the message "Welcome to Mac OS" appears. Then try installing again.

An error message says something is wrong with the hard disk.

- Use a third-party disk repair utility to see if it can repair the disk.
- If you don't have a third-party utility, or if that utility can't repair the disk either, you may need to reinitialize the hard disk.
- After you've reinitialized the disk, use the Mac OS Installer to reinstall system software, then reinstall your application programs.

The Installer cannot update the hard disk driver.

- If you have a PowerBook, make sure you've turned off password protection in the Password Security control panel.
- You may not have an Apple-brand hard disk or you don't have an Apple-brand computer.

Use the disk utility recommended by the manufacturer of your computer or hard disk to update the drivers on your system before installing Mac OS. Make sure to get the latest version of the utility from the manufacturer. An old version will not be able to update your disk with the most current driver.

You may have previously updated your Apple hard disk with a non-Apple disk utility. You need to use the utility you used previously to update the driver again. To ensure a successful update, obtain the latest version of the utility from the manufacturer.

Warning If you use Norton Utilities, make sure you have version 3.5.2 or later. Using earlier versions to repair a Mac OS Extended format hard disk may damage the data on the disk.

The files on your hard disk disappear when you start up from the CD.

- If no files appear on the hard disk except for a single document called "Where have all my files gone?", you started up your computer from a CD with system software earlier than Mac OS 8.1. To see the contents of your disk, you must start up your computer from a disc with Mac OS 8.1 (or later).

You can't install or restore software.

- Make sure your computer started up from the software install CD.

The Installer cannot repair your hard disk.

- If you see a message that the disk can't be fixed because a file is open, quit all programs. If file sharing is on, turn it off. Then try installing again.
- Use Disk First Aid or a third-party disk repair utility to see if it can repair the disk.

Note: Before using a disk utility from a manufacturer other than Apple, see the documentation that came with the software or contact the software manufacturer to make sure the program is compatible with your computer and the version of Mac OS installed on your computer. Apple cannot guarantee the performance of software from manufacturers other than Apple.

If you don't have a third-party utility, or if that utility can't repair the disk either, you may

need to reinitialize the hard disk. After you've reinitialized the disk, try installing the system software again.

The Installer cannot update the hard disk driver.

- If you don't have an Apple-brand hard disk, or if you've updated your Apple hard disk with a non-Apple disk utility, use that disk utility or the one supplied by the disk's manufacturer to update the drivers on your system. Make sure to get the latest version of the utility.
- Some hard disks must be reinitialized before you can update the driver.

You see a message that there's not enough memory to use the Installer.

- Start up the computer using the software install CD. See Chapter 2, "Starting Up From a CD," on page 25.
- If the hard disk is your startup disk, the disk cache or RAM disk setting may be set too high in the Memory control panel. Open the Memory control panel, set your disk cache to the default setting, and reduce or turn off your RAM disk. Then restart the computer.

A message says your computer doesn't have enough memory to use the software.

- Contact an Apple-authorized service provider for information about how to purchase additional memory.

A message says there's not enough disk space.

- Make sure you've selected the correct drive.
- Make more space available on your hard disk by removing some files from the disk. Make backup copies of the files you want to keep. Then drag them to the Trash and choose Empty Trash from the Special menu to delete the files. You don't need to quit the Installer in order to delete files from the disk.

Some of the software you selected may have been successfully installed. The Install Software window in the Installer program indicates which software has already been installed.

You see a message that the System file cannot be modified.

- Make sure you've selected the correct disk as your destination disk.
- You may have virus-protection software installed that guards against modification of the System file. Make sure you are starting up the computer from the software install CD. Drag any virus-protection software out of the System Folder and try installing again. You can put the virus-protection software back after installation.

The System and Finder files may be locked. To see if your System file or Finder file is locked, select the file's icon. Then open the File menu and choose Get Info. If a checkmark appears in the checkbox next to "Locked," the file is locked and cannot be deleted or replaced. To unlock the file, click the checkbox to deselect it.

- The System file may be corrupted. Perform a clean installation of system software.
- You may have file sharing turned on. Open the File Sharing control panel and turn it off.

A message says an item cannot be replaced.

- The Installer is attempting to replace a file, but there is a folder on the disk that has the same name as the file being replaced. Find the folder on your disk and rename it, then try the installation again.
- The file may be corrupted. You need to move or delete the file.
- You may have file sharing turned on. Open the File Sharing control panel and turn it off.
- You may have virtual memory turned on. Open the Memory control panel and turn virtual memory off.
- Start up from the software install CD (see Chapter 2, "Starting Up From a CD") and try reinstalling system software again.

You see a message that the installation was not successful.

You may have an incompatible item in your System Folder. Start up your computer using the software install CD. Then, try doing a clean

installation. See "Performing a Clean Installation".

TITLE

Troubleshooting Handbook: Reinstalling Individual Applications & All Original Software

Article ID: 43036
Created: 8/5/98
Modified: 3/18/99

TOPIC

Reinstalling Individual Applications & All Original Software is part of Chapter 4: Reinstalling Your Computer's Software, of the Troubleshooting Handbook.

DISCUSSION

Reinstalling Individual Applications

If you're having problems with an application or it was damaged or inadvertently erased, try reinstalling that application. If an application came with its own CD, see the software documentation or the Read Me document on that CD for instructions on how to reinstall that software. If not, see the Read Me document on the software install CD for instructions on how to reinstall that software.

Important If you have preferences or settings for individual applications, make a note of them so you can easily reset them if necessary, after you install system software. If you are having problems with your computer, you may not be able to open any files with preferences or customized settings.

Restoring All Original Software

Some computers come with a software restore CD, which contains the Apple Software Restore application. This application lets you restore all your original software, including the system software, factory settings, and applications that came with your computer. You have the option of erasing your hard disk before restoring the original software, or just replacing the original software (Restore In Place).

Before Restoring Your Software

Before you begin the restore process, do the following:

- Customized preferences and settings: If you have preferences or settings in control panels and individual applications, make a note of them so you can easily reset them if necessary, after you install system software.
- Software that runs in the background: If you are using software that runs in the background, such as virus protection software or access control software, you may need to turn it off before you reinstall system software. For instructions, see the documentation that came with the software.
- If you are restoring software on a PowerBook: Plug the PowerBook in, open the Energy Saver control panel, and set the PowerBook so it doesn't go to sleep. Turn off password protection in the Password Security control panel.

Important It is highly recommended that you back up the data on your hard disk before restoring software. Apple is not responsible for any lost data.

Restoring In Place

This procedure replaces only your original software (original system software, factory settings, and applications that came with your computer) with new copies from the CD, leaving everything else on your disk untouched.

1. Start up your computer from the software restore CD and open the Apple Software Restore application.
2. Click the OK button on the introductory screen.
3. If necessary, click Switch Disk to choose the disk on which you want to restore your software.
4. Click the checkbox next to "Restore In Place."

5. Click Restore.
6. An onscreen message shows the status of the restore process.
7. Click Quit when the process is complete.

Important It is highly recommended that you back up the data on your hard disk on an external storage device or network file server before restoring your system.

Important Your preferences may be reset to their original factory defaults, and if you've already registered software, this procedure may modify that data.

7. Click Quit when the process is complete.

Erasing Your Hard Disk

This procedure completely erases the contents of your hard disk before restoring the original contents (original system software, factory settings, and applications that came with your computer).

1. Start up your computer from the software restore CD and open the Apple Software Restore application.
2. Click the OK button on the introductory screen.
3. If necessary, click Switch Disk to choose the disk on which you want to restore your software.
4. Click the checkbox next to "Erase your hard disk before restoring."
5. If necessary, change the disk format you want from the Volume Format pop-up menu. The recommended option is "Same as selected configuration" because it restores your hard disk to the Mac OS Extended format. This format provides more efficient storage, especially on large disks.
6. Click Restore.
7. Click OK.
8. An onscreen message shows the status of the erase and restore process.
9. Click Quit when the process is complete.

Mac OS 8: Not Compatible with Apple WorkGroup Servers

TOPIC

I want to install Mac OS 8 on my Apple WorkGroup Server, but when I get an error that states "This program cannot update the hard drive drivers on the listed devices." How can I install Mac OS 8 on this server?

DISCUSSION

Mac OS 8 is not supported with any configuration of server software at this time. In addition, Apple RAID has not been qualified with Mac OS 8 either.

The error message you received can also appear with certain other Apple branded hard disks since some hard disks are manufactured by third-parties, and are not supported by the Apple disk utilities, including the external 365 MB drive. Before installing Mac OS 8, contact the manufacturer of the drive utility that you use to determine if you need to update your drivers.

If the Apple WorkGroup Server is being setup as a workstation, you should the disk driver using the Drive Setup software.

TITLE

iMac: Type of Memory to Order to Upgrade RAM and
VRAM

Article ID: 58007
Created: 8/13/98
Modified: 10/5/99

TOPIC

What type of random access memory (RAM) is used in iMac?

DISCUSSION

Note: The information in this article is valid for the original iMac only. Refer to TIL article 58466: "[iMac \(Slot Loading\): Memory Upgrades](#)" for information on upgrading that computer.

SUMMARY

The iMac has two memory expansion slots. To expand the built-in memory (DRAM) in your iMac, use the following information when ordering memory:

- DRAM Form Factor - SO-DIMM
- DRAM Type - SDRAM, 3.3 volt (V), unbuffered, 64-bit wide, 144-pin, with Serial Presence Detect
- DRAM Speed - 100 MHz, 10 ns (or faster meaning a lower number)
- Max size of SO-DIMM Supported - 64 MB per slot (revision /A iMac), or 128 MB per slot (revision /B iMac and 266 megahertz iMac)
- Total DRAM Supported - 128 MB with both slots filled (revision /A iMac), or 256 MB (/B iMac, 266 MHz, and 333 MHz iMac)

Note: Although /A iMac computers may work with higher capacity SO-DIMM's than stated, these larger sizes weren't available for official testing at the time of product development, and so therefore aren't included.

Refer to TIL article 43012: "[iMac: Installing Memory \(1 of 2\)](#)" for specific instructions on installing memory into iMac.

To expand the video memory (VRAM) in your iMac, use the following information when ordering VRAM:

- Form Factor - SO-DIMM
- RAM Type - SGRAM

TITLE

iMac: Infrared Communications

Article ID: 58012
Created: 8/13/98
Modified: 10/5/99

TOPIC

Does iMac support infrared communications? How does it work?

DISCUSSION

Note: The infrared port was removed from the iMac beginning with the multi-colored versions introduced in January, 1999.

The iMac does support infrared communications via the Infrared (or IR) transmitter/receiver located behind a dark plastic cover next to the left speaker.

The infrared lens transmits infrared light in a 30-degree radius, pointing outward from the computer. The recommended minimum distance between devices is 1 meter.

The iMac transmits files using the IrDA protocol, which transmits data up to 4 megabits per second and is capable of using AppleTalk and TCP/IP protocols. The iMac infrared port is compatible with some PowerBook computers including the PowerBook 2400, 3400, G3 and PowerBook G3 Series computers. Other infrared capable Apple products are not compatible because they use a different infrared lens and transmitter.

For infrared to function properly with the iMac, the following items must be installed:

- Infrared Control Panel
- IrDALib Extension
- IrLanScanner/PPC Extension

Infrared Control Panel

The Infrared Control Panel provides information about an active Infrared connection as well as infrared type.

Note: The Infrared Control Panel will not open if one of the following conditions occur:

- IrDALib Extension, IrLanScanner/PPC Extension, or Infrared Control Panel are missing, disabled, or corrupted
- The Infrared controller board is defective
- The iMac does not recognize the controller board

Additional information on IrDA compatibility can be found in the following Tech Info Library article:

Modified: 8/17/98

TOPIC

I went through Internet Setup Assistant and entered all my information. I can connect to the internet just fine, but I would like to use Netscape Navigator rather than Microsoft Internet Explorer as my default browser.

DISCUSSION

There are two applications that determine the way your computer accesses the internet, Internet Setup Assistant and Internet Config.

Internet Setup Assistant

If you need to change your internet service provider (ISP) configuration details, you can use the Internet Setup Assistant located under the Apple Menu in the Internet sub-menu. This application automates the process of entering details such as: connection protocol, service name, domain name server address, router (gateway) address and other details.

Most of this information is stored in the TCP/IP control panel preferences as configuration information. You can make a backup of your configuration by opening the TCP/IP control panel, choosing the Configurations option under the File menu, selecting your active configuration and clicking the "export" button. This will save your configuration to a file that can later be imported, without the need to re-enter all your information.

Internet Config

General internet configuration information, such as the default browser, default homepage, helper applications and other settings may be changed using Internet Config application. Internet Config is located in the path: Macintosh HD: Internet: Internet Utilities: Internet Config.

The iMac uses Microsoft Internet Explorer as the default browser, but this setting may be changed using Internet Config. Other settings that determine how your computer routes information may also be changed in Internet Config. Some of the more common settings are:

Email - email Address, email Account, email Password, SMTP Host, email Headers

File Mappings - Extension (i.e. .html) to Application

Helpers - Document type (i.e. sound file) to Application

News - NNTP Host, News Username, News Password

World Wide Web - Home Page

You can make a backup of these settings using the "Save As" option under the Internet Config File Menu. This backup of your Internet Preferences can later be retrieved without the need to re-enter all your information.

TITLE

Macintosh: Blinking Question Mark at Startup

Article ID: 58042
Created: 8/17/98
Modified: 10/8/99

TOPIC

My iMac displays a Flashing question mark when I first power it on, then after a few seconds it continues to boot. Is this normal?

Note: This article also applies to Power Macintosh and PowerBook computers introduced after iMac.

DISCUSSION

Yes, this is normal behavior for the computer if a startup disk has not been selected in the Startup Disk control panel. The blinking question mark does not usually indicate a problem with the computer. Rather, it is displayed while the computer is looking for the System Folder to start up the computer.

If your computer appears to function properly in all other respects, this issue is easily resolved by opening the Startup Disk control panel and selecting your internal hard disk as the startup disk. This directs the Mac OS ROM to the use the selected volume and system folder to start up the computer.

TITLE

iMac: No Sound or Startup Chime Heard

Article ID: 58044
Created: 8/18/98
Modified: 8/26/99

TOPIC

When I power on my iMac, I get no sound, not even a start-up chime. All sound-in and sound-out ports are empty. Does this indicate a hardware problem?

DISCUSSION

It is likely that the system volume setting in the Sound portion of the Monitors & Sound control panel is either at the lowest setting or muted. Unlike previous Macintosh desktop computers, the start-up chime on the iMac is controlled via software sound controls, allowing the volume of the startup chime to be adjusted.

If RAM was recently installed it is possible the audio cable may have been accidentally disconnected or it may not be properly connected. Remove the rear access cover from the computer. You will see four cables attached to the main logic board. The cable furthest to the left is the audio cable. Make sure it is properly connected. Connect the cable if necessary. The Mac OS Info center has directions on how to install memory in your computer. Refer to these directions if you need help removing the rear access cover. Step 10 in the directions has a good diagram depicting the audio cable. If the cable is connected correctly, you may consider having the computer inspected by an Apple-authorized service provider.

TITLE

iMac: ISP Compatibility With v.90 Specification

Article ID: 58046
Created: 8/21/98
Modified: 9/15/99

TOPIC

I seem to have some difficulty connecting to my internet service provider (ISP) with my iMac. I either cannot connect, or my connection is dropped after a few minutes. My 33.6 modem connected with no problem. What's different about iMac that makes connecting more difficult?

DISCUSSION

iMac combines the excitement of the Internet and the simplicity of the Macintosh. The Internet connection experience via the iMac is nothing out of the ordinary. The modem used in the iMac is a 56K modem based on the new V.90 specification. Any time a new modem standard is introduced there is a period of adjustment while various ISPs work to ensure that their POP (Point of Presence) servers are compatible with the new specification.

If you are having difficulty connecting to a specific ISP, you may wish to contact them to ensure they are currently using V.90 compliant modems, or have plans to update to them in the near future. In the mean time, Apple has released a modified modem script for the iMac Internal 56k modem that will result in more reliable connections. This script forces the modem to connect at 33.6 kbps or lower speeds. These connections are more robust in situations where the phone line quality is marginal.

This CCL modem script can be found in the Apple Software Updates site. This URL will take you to Apple's Software Updates web site so you can download the "iMac v34 Only Modem Script.smi" file: <http://asu.info.apple.com/swupdates.nsf/artnum/n11128>

TITLE

iMac: Hole in I/O Door Not For Cables

Article ID: 58055
Created: 8/28/98
Modified: 10/8/99

TOPIC

I routed all of my cables through the hole in the I/O door on my iMac, but it is hard to open because there is not enough room for my finger. Should the cables not be routed through the hole?

DISCUSSION

As pictured in step 5 of the tri-fold "Welcome to your iMac" pamphlet, the cables should be routed through the large gaps at the bottom of the I/O door. The large hole provides the only convenient means of opening the I/O door. Routing cables through the hole may also cause them to become disconnected when the I/O door is opened.

The iMac (Slot Loading) does not have a door over the I/O ports so this is not an issue.

TITLE

Mac OS 8.5: Error Opening Internet Control Panel or File Exchange

Article ID: 58168
Created: 10/30/98
Modified: 10/30/98

TOPIC

I'm trying to go into the Internet control panel and I'm getting an error stating "To use the Internet control panel, you must first install Internet Config Extension version 2.0, or later." I've also tried to open the File Exchange Control Panel and it gives me an error saying "Internet Config is not installed properly." What's wrong?

DISCUSSION

Both the Internet Control Panel and the File Exchange Control Panel in Mac OS 8.5 use version 2.0.2 of the Internet Config Extension. However, several installers (typically web browsers and email programs) may automatically replace that extension with an older version.

The only way to resolve this is to use the Mac OS 8.5 Installer and do a custom install of the internet control panel (when you do this, the installer will automatically reinstall the Internet Control Panel as well as the latest version of the internet config extension).

TITLE

iMac: When to Install Available Updaters

Article ID: 58174
Created: 11/9/98
Modified: 1/20/00

TOPIC

This article provides a table for each iMac model showing which updates should be installed.

DISCUSSION

The following table lists the update or updates you may need, depending upon which iMac model you own. Under each iMac model is the list of updates that should be installed on your computer. If you are unsure if your iMac has a particular update installed, download and run the update installer. If the update is present, the installer will alert you.

Updates can be located and downloaded from the Apple Software Updates Web site at <http://www.apple.com/swupdates>. Use the name of the update as your search query.

233 MHz iMac running Mac OS 8.1 M6709x/A

Update Name	Notes
iMac Update 1.0 (no longer available from Apple Software Updates)	1
iMac v.34 Only Modem Script	2
Apple Modem Updater 1.3.5	3
iMac CD Update 2.0	4
iMac Firmware Update 1.2	10

233 MHz iMac upgraded to Mac OS 8.5 M6709x/A

Update Name	Notes
iMac v.34 Only Modem Script	2
Apple Modem Updater 1.3.5	3
iMac CD Update 2.0	4
Mac OS 8.5.1 Update	5
iMac Firmware Update 1.2	10
iMac Update 1.1	7,9

233 MHz iMac M6709x/B

Update Name	Notes
Apple Modem Updater 1.3.5	3
iMac CD Update 2.0	4
Mac OS 8.5.1 Update	5
iMac Firmware Update 1.2	10
iMac Update 1.1	7,9

266 MHz iMac: M7389LL/A Strawberry, M7392LL/A Lime, M7391LL/A Tangerine, M7390LL/A Grape, M7345LL/A Blueberry

Update Name	Notes
iMac Firmware Update 1.2	10
iMac CD Update 2.0	4

333 MHz iMac: M7441LL/A Strawberry, M7444LL/A Lime, M7443LL/A Tangerine, M7442LL/A Grape, M7740LL/A Blueberry

Update Name	Notes
iMac Firmware Update 1.2	10
iMac CD Update 2.0	4

All iMacs running Mac OS 8.6 only:

Update Name	Notes
Mac OS ROM 1.0 Update	11

iMac DV or iMac DV Special Edition with internal DVD-ROM drive:

Update Name	Notes
iMac DVD Update 1.0	12

Notes:

1. The contents of the iMac update 1.0 have been incorporated into Mac OS 8.5. You will not need to install this update on any M6709x/B (Rev. B) iMac or later, or on any original iMac that has been upgraded to Mac OS 8.5 in any language.
2. This file is only needed if you are having difficulty making and maintaining modem connections. It is installed by the Mac OS 8.5 that ships with the Rev. B iMac. It is not part of the retail Mac OS 8.5 package.
3. In early versions of the Rev. B iMac, the modems will not have the version 2.2 firmware installed. As such, you should run the modem updater located in the CD Extras folder of the System Software CD bundled with iMac.
4. The iMac CD Update 2.0 incorporates the iMac CD Update 1.0. Apple recommends all iMac users install the 2.0 update.
5. Apple recommends all Mac OS 8.5 owners install this update.
6. (this item left intentionally blank; no longer used.)
7. Customers outside the United States should use the localized version of the update to ensure proper operation.
8. (this item left intentionally blank; no longer used.)
9. The iMac Update 1.1 requires the prior installation of Mac OS 8.5 or 8.5.1, and the iMac Firmware Update. If you have an original iMac running Mac OS 8.1, you cannot use the iMac Update 1.1 until you update to Mac OS 8.5. Learn how to update to Mac OS 8.5 by going to the Web site appropriate to your geographical location:

<http://www.apple.com.au/macOS/> for Australia,
<http://www.media.euro.apple.com/MacOSonline/Europe/UpToDate> for Europe,
<http://asu.info.apple.com/> for North America.
10. The iMac Firmware Update version 1.2 should be installed on all iMac computers used in NetBoot client environments. The update also corrects a rare condition wherein SGRAM amounts over 2MB may not be properly identified at startup. This update incorporates the iMac Firmware Update 1.1.
11. Apple recommends that every iMac customer running Mac OS 8.6 install this update. For additional information on this update please read TIL Article 60408: "[Mac OS ROM Update 1.0: Read Me](#)"
12. iMac DVD Update 1.0 places new firmware on the DVD-ROM shipped in iMac DV and iMac DV Special Edition computers. This update improves the ability of iMac DV models to read certain CD-ROM discs and to determine if a disc is unreadable. For additional information on this update please read TIL Article 58557: "[iMac DVD Update 1.0: Read Me](#)"

TITLE

iMac: Confirming Installation of the Apple Modem Updater

Article ID: 58175
Created: 11/17/98
Modified: 1/13/00

TOPIC

I just installed the Apple Modem Updater on my iMac and want to be sure the Updater installed properly. How can I confirm that the modem ROM was updated?

DISCUSSION

NOTE: The following information can be used to confirm the installation of the Modem Update for iMac and PowerBook G3 Series computers.

There are two methods for verifying the update was installed. First is to simply run the updater again. If the modem ROM was updated, it will return the following message in the status window:

"This updater contains the same firmware as the modem. Check www.apple.com/support for a more current version of Apple Modem Updater."

In the event that you do not have access to the updater, you can use a terminal program to confirm the ROM is updated. Enter the following AT commands for your modem in your terminal program; on the iMac you can use the AppleWorks communications module.

Setup the connection using the Serial Tool and then enter:

```
ati3
```

If the modem's firmware has been updated, it will return the following information:

```
V2.200-V90_2M_DLS
```

```
OK
```

If the modem firmware has not been updated, it will return the following:

```
V2.100-V90_2M_DLS
```

```
OK
```

TITLE

Mac OS 8.5/8.6: Performing a Clean Install

Article ID: 58176
Created: 11/17/98
Modified: 6/18/99

TOPIC

This article, taken from the Mac OS Info Center on your hard drive, describes the clean install procedure for Mac OS 8.5, 8.5.1, and 8.6

DISCUSSION

Performing a clean installation creates a new System folder on your hard disk. The old System folder is renamed Previous System Folder. You may want to perform a clean installation if you are having persistent problems with your computer that a normal reinstallation does not solve.

IMPORTANT: Because your computer has a new System Folder, after a clean install you must reinstall any third-party fonts, extensions, and control panels that you have added to your system or that came with programs you have installed.

The steps below assume that you are accepting the default choices for installing system software. You may customize what gets installed by manually selecting the various system software components after clicking the Customize button.

To perform a clean installation:

1. Start up your computer from the system software CD.
2. Open the Mac OS Installer application.
3. In the Welcome dialog box, click Continue.
4. In the Select Destination dialog box, click the Options button.
5. Select the Perform Clean Installation option, then click OK.
6. Select the destination hard disk, then click the Select button.
7. Click Start to begin installation.

TITLE

Power-On Self Test Beep Definition - Part 1

Article ID: 58183
Created: 1/1/99
Modified: 12/21/99

TOPIC

What do the beeps during the Power-On Self Test (POST) mean?

Refer to TIL article 58442: "[Power On Self Test Beep Definition - Part 2](#)" for information on more recent Macintosh computers.

DISCUSSION

The power-on self test resides in the ROM of the computer. Only computers that are based on the ROM-in-RAM (New World) technology, such as the iMac, Power Macintosh G3 (Blue and White), Power Mac G4 (PCI Graphics), and PowerBook G3 Series (Bronze keyboard) will generate these beeps. This test runs whenever the computer is powered on after being fully shut down (the power-on self test does not run if the computer is only restarted).

If a fault is detected during the test, you will not hear a normal startup chime. Instead, the system will beep as explained below. If you experience one of these beeps, you should call your Apple-authorized service provider for additional troubleshooting assistance.

- 1 beep = No RAM installed/detected
- 2 beeps = Incompatible RAM type installed (for example, EDO)
- 3 beeps = No RAM banks passed memory testing
- 4 beeps = Bad checksum for the remainder of the boot ROM
- 5 beeps = Bad checksum for the ROM boot block

TITLE

Power Macintosh: Differences Between DVD-ROM,
DVD-RAM, and DVD+RW

Article ID: 58187
Created: 1/1/99
Modified: 1/11/00

TOPIC

What is the difference between DVD-ROM, DVD-RAM, and DVD+RW?

DISCUSSION

DVD-ROM, as its name implies, is a Digital Versatile Disc read-only media. You can access the contents on it, be it movies or games, but you cannot write to it.

DVD-RAM (DVD random-access memory) and DVD+RW (DVD rewritable) are both rewritable mediums. However, DVD+RW is a new rewritable format and has not yet been standardized. DVD-RAM on the other hand, is the official rewritable DVD standard and has been finalized and published by the DVD Forum, which consists of 10 major corporations including industry heavyweights like Matsushita, Toshiba, Hitachi and Time Warner.

TITLE

Power Macintosh G3 (Blue and White): SCSI FAQ

Article ID: 58204
Created: 1/1/99
Modified: 1/11/00

TOPIC

This article provides information on the various SCSI standards and how they relate to the SCSI cards currently available from Apple for the Power Macintosh G3 (Blue and White) and Power Mac G4 (AGP Graphics).

DISCUSSION

Apple SCSI FAQ

Question: What is SCSI?

Answer: SCSI, or Small Computer System Interface, is a standard for connecting peripherals to your computer, including disk and cartridge drives, CD-ROM drives, scanners, and other devices. A SCSI port was included on most Macintosh systems up until the iMac and the 1999 models of the Power Macintosh G3 and Macintosh Server G3.

Question: What are the differences between the various types of SCSI?

Answer: SCSI implementations vary depending on a number of different characteristics. Each type of SCSI can support the transfer of data at a certain speed, measured in megabytes per second. SCSI types are also characterized by the number of devices that can be connected to each channel or bus and the HPbs maximum cable length supported. Different types of SCSI also use different connectors. The chart below summarizes the difference:

Type of SCSI	Max. Transfer Rate (MBps)	Max. Devices	Max. Cable Length	Connector Types Used
SCSI-1	5	7	3 meters	25-pin 50-pin Centronics
SCSI-2 (Fast)	10	7	3 meters	50-pin high density 50-pin standard 50-pin Centronics
Ultra Narrow	20	15	1.5 meters	50-pin high density 50-pin standard 50-pin Centronics
Ultra Wide	40	15	1.5 meters	68-pin high density
Ultra2 LVD	80	15	12 meters	68-pin high density

You'll find good reference for many SCSI-related terms on the Adaptec Web site at <http://www.adaptec.com/tools/glossary/general.html>.

Question: Why did Apple remove the SCSI port from the logic board of the new Power Macintosh G3 (Blue and White) and Macintosh Server G3 systems?

Answer: Apple has provided a new method of connecting peripherals, called FireWire, on every Power Macintosh G3 (Blue and White) and Macintosh Server G3 system. FireWire will revolutionize the way individuals connect high-speed devices to their Macintosh. It provides such features as hot pluggability, support for up to 63 devices, easy cable connectivity, and even bus-supplied power, which make it the perfect successor to SCSI as a means to connect external peripherals. By including FireWire in every Power Macintosh, Apple is providing its customers with high-performance and easy-to-use I/O technology that will be used far into the future.

Question: What SCSI options are available from Apple for the new Power Macintosh G3 (Blue and White) and G3 Server systems?

Answer: Apple offers a number of SCSI options for optimal hard disk performance and connectivity to older SCSI devices. The following options are available from Apple:

Ultra SCSI PCI card

The Ultra SCSI PCI card is offered as a build-to-order option at the Apple Store. It works in any new (1999 model) Power Macintosh G3 or Macintosh Server G3 configuration. The card allows users to connect external SCSI peripherals to the Macintosh, such as scanners, tape drives, and hard disks that use standard SCSI (SCSI-1), Fast SCSI (SCSI-2), and Ultra SCSI (also called Ultra Narrow SCSI). It supports booting the Macintosh from externally connected devices. The card comes with a high-density 50-pin external connector and a 50-pin to 25-pin female SCSI adapter to ensure compatibility with existing SCSI cabling. The card also comes with a 50-pin internal connector that is unsupported by Apple. You can connect up to seven external Ultra Narrow devices to the card with a total cable length of 1.5 meters. You can connect up to seven SCSI-1 and SCSI-2 devices to the card with a total cable length of 3 meters. You can also connect a mix of SCSI-1, SCSI-2, and Ultra Narrow external devices, but you will be limited to a total cable length of 1.5 meters.

Single-channel SCSI card (Ultra2 LVD)

The single-channel SCSI card is installed in some configurations of the Power Macintosh G3 and Macintosh Server G3. It is also available through the Apple Store, with a number of hard drive configurations to choose from. This card connects to internal and external Ultra2 LVD SCSI devices. The cable connected to the card provides support for up to three internal Ultra2 LVD SCSI devices. The card supports booting the Macintosh from internal or external devices. It comes with a 68-pin internal connector and a 68-pin external connector. You can connect up to 15 Ultra2 devices to the single-channel SCSI card with a total cable length, both internally and externally, of 12 meters. Apple does not recommend connecting other types of SCSI devices to the single-channel card due to possible cabling limitations or effects on the performance of the internal Ultra2 LVD SCSI hard drives.

Dual-channel SCSI card (Ultra2 LVD) Version 1

The dual-channel SCSI card is offered as a configure-to-order option at the Apple Store with certain hard drive configurations, including the option of three 36GB hard drives, for the Power Macintosh G3 (Blue and White) and Macintosh Server G3. The dual-channel card provides two independent Ultra2 LVD SCSI channels, Channel A and Channel B. Internal Ultra2 LVD SCSI hard drives are connected to the internal Channel B connector. External or internal SCSI devices can be connected to the external or internal Channel A connectors. This card is the perfect all-in-one solution for customers who want to use high-performance internal Ultra2 disk drives and external SCSI peripherals at the same time.

The card comes with two 68-pin internal connectors (Channels A and B), a 50-pin internal connector (Channel B), and a 68-pin external connector (Channel A). You can connect up to 30 Ultra2 SCSI devices to the card with a total cable length, both internally and externally, of twelve meters. You can connect up to 11 Ultra Narrow or Ultra Wide devices with a total cable length, both internally and externally, of 1.5 meters. You can connect up to seven SCSI-1 or SCSI-2 devices to the external channel (Channel A) with a total cable length, both internally and externally, of 3 meters. You can also connect a mix of SCSI-1, SCSI-2, Ultra Narrow, and Ultra Wide devices on the external channel (Channel A), but you will be limited to a total cable length, both internally and externally, of 1.5 meters. The internal 50-pin connector (Channel B) is unsupported by Apple.

Dual-channel SCSI card (Ultra2 LVD) Version 2

The version 2 dual channel SCSI card is functionally equivalent to the version1 card, though it has been tested and approved for use with the Power Mac G4 (AGP Graphics) computer. Refer to the chart below for more specific technical information. The card is based on the ATTO ExpressPCI UL2D card. You may refer to the ATTO Web site at <http://www.attotech.com> for more information on it.

The chart below illustrates many of the technical differences between the various Apple SCSI cards.

Specification	Ultra SCSI	Single Channel	Dual Channel version 1	Dual Channel version 2
Supported Computer	Power Macintosh G3 (Blue and White) and Power Mac G4	Power Macintosh G3 (Blue and White)	Power Macintosh G3 (Blue and White)	Power Mac G4 (AGP Graphics)
Max. Transfer Rate (MB/Sec)	20	80	80 per channel	80 per channel
Apple Supported Types	SCSI-1, SCSI-2 (Fast), Ultra Narrow	Ultra2 LVD	Channel A: SCSI-1, SCSI-2 (Fast), Ultra Narrow, Ultra Wide, Ultra2 LVD Channel B: Ultra2 LVD	Channel 1: SCSI-1, SCSI-2 (Fast), Ultra Narrow, Ultra Wide, Ultra2 LVD Channel 2: Ultra2 LVD
Internal Connector	50-pin standard (Male) (Not Apple Supported)	68-pin high-density Ultra2 (Female)	Channel A: 68-pin high-density Ultra2 (Female) Channel B: 68-pin high-density Ultra2 (Female), and 50-pin standard (Male) *	Channel 2: 68-pin high-density Ultra2 (Female)

External Connector	50-pin high-density (Female) Includes a high density 50-pin to DB25 adapter	68-pin high-density Ultra2 (Female)	Channel A: 68-pin high-density Ultra2 (Female) **	Channel 1: 68-pin VHDCI Ultra2 (Female)
Max. Devices Int/Ext	Up to 7 total	Up to 15 total	Up to 30 total	Up to 30 total
Maximum Cable Length Internal/External	3 meters w/non-Ultra devices; 1.5 meters w/Ultra devices or a mix of Ultra and non-Ultra devices	12 meters w/only Ultra2 LVD devices	Channel A: 3 meters w/non-Ultra devices; 1.5 meters w/Ultra devices or a mix of Ultra and non-Ultra devices; 12 meters w/only Ultra2 LVD devices Channel B: 12 meters w/only Ultra2 LVD devices	Channel 1: 3 meters w/non-Ultra devices; 1.5 meters w/Ultra devices or a mix of Ultra and non-Ultra devices; 12 meters w/only Ultra2 LVD devices Channel 2: 12 meters w/only Ultra2 LVD devices
PCI System Bus	32 bit	32 bit	64 bit	64 bit
Driver Compatibility	Compatible with SCSI Manager 4.3, and earlier drivers	Requires SCSI Manager 4.3 compliant driver	Requires SCSI Manager 4.3 compliant driver	Requires SCSI Manager 4.3 compliant driver

* 50-pin standard (Male) (Not Apple Supported)

Question: What do I do about my older SCSI devices that I want to use?

Answer: Apple offers two SCSI solutions to accommodate the transition between older SCSI devices and FireWire devices. Those options, the Ultra SCSI PCI card and the dual-channel SCSI card, are described in detail above. In addition, a number of vendors are delivering SCSI card solutions for the Power Macintosh G3.

The Adaptec PowerDomain 2930 is an Ultra Narrow SCSI PCI card that supports devices with an external high-density 50-pin connector and an internal standard 50-pin connector (the card ships with an internal SCSI cable). The PowerDomain 2930 supports up to seven internal or external SCSI-1, SCSI-2, and Ultra Narrow SCSI devices. You can boot the new Power Macintosh G3 from internal or external devices with the PowerDomain 2930. For more information, see <http://www.adaptec.com/products/overview/pd2930u.html>.

See Adaptec's Web site for more information on Macintosh SCSI solutions:
<http://www.adaptec.com/products/solutions/macintosh.html>.

Question: What happens if I connect older SCSI devices to the single-channel SCSI Ultra2 LVD card that ships in my Power Macintosh G3 or Macintosh Server G3?

Answer: Depending on the type of SCSI device that you connect to the external 68-pin connector on the single-channel SCSI Ultra2 LVD card, you may exceed cable length limitations or slow down the speed of your SCSI bus. For example, connecting an external SCSI-2 drive to the single-channel SCSI card will slow the entire Ultra2 SCSI bus from a maximum throughput of 80 MBps to 40 MBps. It also may exceed the maximum cable length of 1.5 meters supported by Ultra Narrow SCSI because the cable connecting the internal Ultra2 hard drive is already nearly 1 meter long. Therefore, Apple strongly recommends that customers do not connect slower SCSI devices to the single-channel SCSI card.

Question: What happens when I mix different types of SCSI devices on the same SCSI channel or bus?

Answer: Both the speed and cable length limitations of different devices can be affected by mixed SCSI types on a single bus or channel. Any mix of SCSI-1, SCSI-2, Ultra Narrow, and Ultra Wide devices does not affect the maximum throughput of any non-Ultra2 LVD SCSI bus or channel. For example, a SCSI-1 CD-ROM drive, a SCSI-2 Jaz drive, and an Ultra Wide hard drive all connected to an Ultra Wide SCSI bus, will all operate at their respective speeds (5 MBps for SCSI-1, 10MBps for SCSI-2, and 40 MBps for Ultra Wide) because the Ultra Wide SCSI bus supports up to 40 MBps. Mixing SCSI-1 and SCSI-2 devices with Ultra Narrow and Ultra Wide devices always results in a maximum cable length, both internally and externally, of 1.5 meters.

An Ultra2 LVD SCSI bus or channel with a mix of Ultra2 LVD and non-Ultra2 LVD devices will operate at a maximum throughput of 40 MBps, instead of 80 MBps. For example, a SCSI-1 CD-ROM drive, a SCSI-2 Jaz drive, an Ultra-Wide hard drive, and an Ultra2 LVD hard drive all connected to an Ultra2 LVD SCSI bus, will operate at their respective speeds except for the Ultra2 LVD hard drive, which will be limited to 40MBps. Mixing Ultra2 LVD devices with non-Ultra2 LVD devices always results in a maximum cable length, both internally and externally, of 1.5 meters.

Question: Do the Apple SCSI cards support all SCSI devices?

Answer: The single-channel and dual-channel SCSI cards do not support all SCSI devices. These cards support only devices that are SCSI Manager 4.3-compliant. The Ultra SCSI PCI card is specifically designed to support older SCSI devices and will work with most older

..TIL58204-Power_Macintosh_G3_(Blue_and_White)_SCSI_FAQ.pdf

devices. To find out whether a specific SCSI peripheral is SCSI Manager 4.3-compliant, contact the vendor of the peripheral for more information.

TITLE

Apple Studio Display 21: Do Not Daisy Chain Multiple Displays Together	Article ID: 58214 Created: 1/4/99 Modified: 1/13/00
--	---

TOPIC

I noticed there are four USB ports on the Apple Studio Display 21". Can I use one of those ports to daisy chain the USB cable when using more than one Apple Studio Display on my Power Macintosh G3 (Blue and White)?

DISCUSSION

If you daisy chain multiple Apple Studio Display 21" displays together, the Power Macintosh G3 (Blue and White) may restart itself approximately 3-5 seconds after you shut down. If this occurs, reconnect the additional displays directly to your Power Macintosh G3 (Blue and White).

Alternatively you can use a USB hub. Although the Apple Studio Display 21" is a USB hub, the four ports on the side should be used for connecting other USB devices.

Note: The Viewable Image Size of the Apple Studio Display 21" is 19.8 inches.

TITLE

Apple Studio Display 17: Noise or Shimmer at Startup is Normal

Article ID: 58216
Created: 1/4/99
Modified: 8/10/99

TOPIC

I notice that when I start up my computer, my Apple Studio Display 17 makes a noise and the image shimmers a bit then settles down. Is there a problem with the display?

DISCUSSION

No, the display is behaving normally and does not require service. What is happening is called Degaussing. Degaussing is the process of stabilizing the magnetic field of the CRT. It is a normal function of every display and does not indicate a need for service.

Waking the display from sleep or initiating a degauss from the on-screen display can also cause the same noise to be generated.

Note: The Viewable Image Size of the Apple Studio Display 17 is 16.0 inches.

TITLE

Apple Studio Display 21/Apple Studio Display 17: Tripod
Stand Safety Tips

Article ID: 58217
Created: 1/4/99
Modified: 1/13/00

TOPIC

This article provides specific safety tips relating to the new tripod stand used on the Apple Studio Display 21" and Apple Studio Display 17" displays.

DISCUSSION

- Lift the display by the indentations on the under-sides near the front of the display. Never lift the display by the tripod stand.
- Likewise, do not adjust the position of the monitor by pulling the stand legs. The tripod stand is subject to damage if mishandled.
- When placing the monitor on a table surface, ensure that all three legs on the tripod stand contact a solid surface. If one of the legs is too close to the table edge, the weight of the monitor could cause the display to fall off the edge.

Note: The Viewable Image Size of the Apple Studio Display 21" is 19.8 inches, the Apple Studio Display 17" has a Viewable Image Size of 16.0 inches.

TITLE

Power Macintosh G3 (Blue and White): Possible to Use
Both ADB and USB Devices

Article ID: 58223
Created: 1/4/99
Modified: 1/11/00

TOPIC

Since the Power Macintosh G3 (Blue and White) has both ADB and USB ports, can I mix and match input devices?

DISCUSSION

Yes, it is possible to use both USB and ADB input devices on the Power Macintosh G3.

Be aware that if you have two similar input devices, such as a USB mouse and an ADB mouse, connected simultaneously, the results are unpredictable and it is not recommended. However, using a USB mouse with an ADB keyboard for example is fine.

TITLE

Apple Studio Display 21: Description

Article ID: 58229
Created: 1/6/99
Modified: 1/13/00

TOPIC

This article provides a description of the new Apple Studio Display 21".

DISCUSSION

Color is indispensable to today's computer applications, whether you are producing magazines, creating business presentations, or designing multimedia materials.

The Apple Studio Display with ColorSync technology is an uncompromising monitor that provides accurate color for every situation. It combines lifetime color calibration with out-standing visual performance and a stunning appearance--all for little more than competitive monitors without those features.

The first thing you will notice about this Apple Studio Display is its striking appearance. Its elegant translucent enclosure and sleek design complements our newest Power Macintosh G3 systems and is also highly functional. It includes a four-port Universal Serial Bus (USB) hub, and its unique stand has room underneath to store your keyboard.

The Apple Studio Display with ColorSync technology uses a 21-inch (19.8-inch viewable image size) Trinitron CRT to deliver vivid colors and sharp text. The cylindrical design of this CRT creates a vertically flat screen that minimizes glare. The end result is a monitor that's a pleasure to view and to work with.

But the most important feature of the Apple Studio Display with ColorSync technology is its superior color accuracy--and its ability to maintain that accuracy over its lifetime. Using a patented internal measurement system, the monitor adjusts its electron beam as time passes to maintain the precise calibrations made at the factory. It can also compensate for changes in the ambient light. And because it stores its own ColorSync profiles, it can exchange accurate color information with the other devices in your production process, creating color consistency that directly translates into fewer trial-and-error stages when you output color documents.

The Apple Studio Display makes it easy to meet your specific needs and to compensate for changes in environmental conditions. A button on the display brings up the familiar Macintosh Monitors & Sound control panel on your computer, giving you powerful yet intuitive software control over all screen adjustments.

With its large screen, crisp Trinitron performance, ready-to-use USB ports, built-in color calibration, and elegant design, the Apple Studio Display with ColorSync technology is the complete monitor for demanding applications.

Exceptional Display Quality

- 21-inch (19.8-inch viewable image size) Sony Trinitron CRT
- aperture grill technology for vivid colors and sharp text
- vertically flat screen for reduced glare

Stunning Design

- elegant translucent case that matches Apple's latest Power Macintosh G3 computers
- storage space under the display for your keyboard
- four-port USB hub for connecting peripherals

Built-In Color Calibration

- uses industry-standard ColorSync color management technology
- ensures consistent, accurate color over the lifetime of the monitor
- saves production time by creating accurate output with fewer trials

Easy Access to Powerful Software Controls

- Single-button access to the familiar Macintosh Monitors & Sound control panel
- intuitive control over all screen adjustments

Ordering Information

- Apple Studio Display with ColorSync technology
- order No.M6204LL/A
- Apple Displays software
- VGA-to-Macintosh adapter
- power cord
- ambient light tool
- user's setup guide
- limited warranty

Apple Studio Display 17: Description

Article ID: 58231
Created: 1/6/99
Modified: 1/13/00

TOPIC

This article provides a description of the Apple Studio Display 17".

DISCUSSION

Looking for a monitor that's big enough to keep you productive, without taking up too much of your desk space--or your budget?

The perfect companion to your new Power Macintosh G3 system, the Apple Studio Display combines a gorgeous screen, a stunning look, and a competitive price. It's a great choice for a wide variety of applications from business to education to science and engineering to the home.

The first thing you'll notice about the Studio Display is its striking appearance. Its elegant translucent enclosure and sleek design complement our newest computer systems. And its unique stand even has room underneath to store your keyboard when you are not using it.

The high quality of this display comes from a 17-inch (16.0-inch viewable image size) Mitsubishi Diamondtron CRT. These CRTs feature aperture grille technology for vivid colors and sharp text. And their vertically flat screens minimize glare to make your viewing more comfortable.

On-screen controls let you quickly adjust the Apple Studio Display to meet your specific needs and to compensate for changes in environmental conditions. The monitor meets strict worldwide standards for energy consumption, electromagnetic emissions, and recyclability.

Put all those features together and you have a high-quality display for a much lower price than you would expect. That makes the Apple Studio Display one of the best monitor values available for your Macintosh system--and one you will enjoy inside and out every day you use it.

Features

Superb Screen Quality

- 17-inch (16.0-inch viewable image size) Mitsubishi Diamondtron CRT
- aperture grill technology for vivid colors and sharp text
- vertically flat screen for reduced glare

Stunning Design

- elegant translucent case that matches Apple's latest Power Macintosh G3 computers
- storage space under the display for your keyboard

Advanced Architecture

- supports high-resolution display at flicker-free refresh rates
- includes on-screen controls for easy setup and adjustment to environmental variations
- meets strict EPA ENERGY STAR and TCO 95 requirements

Ordering Information

- Studio Display Order No.M6221LL/A
- Apple Displays software
- power cord
- VGA-to-Macintosh adapter
- user's manual

- limited warranty

TITLE

Power Macintosh G3 (Blue and White): Frequently Asked Questions

Article ID: 58238
Created: 1/11/99
Modified: 1/4/00

TOPIC

This article contains frequently asked questions and answers relating to the new Power Macintosh G3 (Blue and White).

- What type of memory does the Power Macintosh G3 (Blue and White) use? Is the memory the same as in other Power Macintosh G3 systems?
- What is the maximum amount of memory that can be put in the Power Macintosh G3 (Blue and White)?
- What is FireWire?
- What is USB? Is it the same technology used in iMac?
- What graphics accelerator does the Power Macintosh G3 (Blue and White) use? Can you tell me more about the 66-MHz PCI slot? Are the other three slots standard PCI slots?
- Does the Power Macintosh G3 (Blue and White) have a floppy disk drive or serial port?
- What kinds of hard disk drives does the Power Macintosh G3 (Blue and White) support? How many devices does it support? How do I connect my older I/O devices?
- Does the Power Macintosh G3 (Blue and White) come with a modem?
- What version of the Mac OS does the Power Macintosh G3 (Blue and White) include?
- Is it possible to start up from a FireWire hard drive?

DISCUSSION

Q. What type of memory does the Power Macintosh G3 (Blue and White) use? Is the memory the same as in other Power Macintosh G3 systems?

A. The Power Macintosh G3 (Blue and White) requires PC100-compliant SDRAM. The memory must be 3.3-volt, unbuffered, 168-pin. If an SDRAM DIMM is sold or marketed as "PC100," this helps ensure that it will function correctly and optimally in your system. Please check with the manufacturer before purchasing. Memory from prior Power Macintosh (EDO or FPM RAM) computers cannot be used in this system.

Q. What is the maximum amount of memory that can be put in the Power Macintosh G3 (Blue and White)?

A. The Power Macintosh G3 (Blue and White) has four DIMM slots that can accommodate up to 256MB DIMMs each, for a total of 1,024MB (1 gigabyte) of memory. When using 256MB DIMMs, use 128Mbit-device technology, not 64Mbit or 256Mbit. The 256MB DIMMs are available from the Apple Store.

Q. What is FireWire?

A. FireWire, also known as IEEE 1394, is an industry-standard, high-speed input/output (I/O) technology that can support multimedia and high-bandwidth devices like printers, digital cameras, and FireWire hard disk drives. Apple has even included 15 watts of bus power that will spawn a whole new class of easy-to-use self-powered devices such as hard drives and cameras. FireWire is perfect for digital-video editing. The two FireWire ports on the Power Macintosh G3 (Blue and White) system support transfer speeds of up to 400 megabits-per-second (Mbps). FireWire lets you plug in and unplug devices without restarting the system. There are no device ID numbers to track, and the cables are long (14 feet) and easy to snap in. FireWire supports up to 63 devices. Information about FireWire technology can be found at:<http://www.apple.com/firewire>.

Q. What is USB? Is it the same technology used in iMac?

A. The USB (Universal Serial Bus) implementation in the Power Macintosh G3 (Blue and White) is the same as iMac. USB is a standard for attaching peripheral devices to a personal computer, delivering higher performance (up to 12 megabits-per-second) than previous serial port connection methods. USB is used to connect devices such as keyboards, mice, trackballs, modems, printers, scanners, and joysticks. You can plug in and unplug USB devices without restarting the system. Maximum cable length is 5 meters. Up to 127 USB devices can be attached to the computer simultaneously. The new Power Macintosh G3 system ships with two USB ports. Apple also provides a USB keyboard and USB mouse with each system. The Apple USB Keyboard includes a built-in, bus-powered hub with two additional USB ports. The Power Macintosh G3 (Blue and White) also includes an Apple keyboard extender cable that increases the length of the Apple USB Keyboard cable and gives you the option to place the system either on the desktop or on the floor. Information about USB technology can be found at: <http://www.apple.com/usb>.

Q. What graphics accelerator does the Power Macintosh G3 (Blue and White) use? Can you tell me more about the 66-MHz PCI slot? Are the other three slots standard PCI slots?

A. All Power Macintosh systems come standard with the latest graphics accelerator chip from ATi, the RAGE 128. It includes 16MB of SDRAM graphics memory that provide extraordinary multitexturing valued by games developers. This speedy graphics card provides stellar 2D performance to support large displays and great 3D performance for professional 3D applications and games. The RAGE 128 card has an industry-standard VGA video connector. For customers who want to connect the Power Macintosh to older Macintosh-type (DB-15 pin) connectors, Apple supplies a VGA-to-Macintosh connector in the accessory kit. The three 33-MHz, 64-bit PCI slots are PCI 2.1-compliant slots and can also accommodate 33-MHz, 32-bit cards. You can add many different types of cards, including graphics, networking, or cards that support storage devices.

Q. Does the Power Macintosh G3 (Blue and White) have a floppy disk drive or serial port?

A. Like iMac, this system does not have a floppy disk drive. If you need to use a floppy disk drive, there are several third-party solutions available on the market. If you need to support serial devices, you can purchase third-party adapters or PCI cards. There is no serial port in the system. If you need to support ADB, or SCSI devices, you can use third-party dongles, adapters, PCI cards, or external connection boxes. Apple is aggressively embracing I/O technologies such as FireWire and USB that allow you to attach devices directly to the system. There are several other options for getting information in or out of the system, including Internet access, optional internal Zip drives, LAN, and other mass-storage devices.

Q. What kinds of hard disk drives does the Power Macintosh G3 (Blue and White) support? How many devices does it support? How do I connect my older I/O devices?

A. The Power Macintosh G3 (Blue and White) system comes with an Ultra ATA hard disk drive or Ultra2 Low Voltage Differential (LVD) SCSI hard disk drive. Ultra2 SCSI is the next generation of SCSI. The Ultra2 LVD option includes a SCSI hard disk and a SCSI PCI card in one of the PCI slots. It doubles the data burst rate, up to 80 megabytes-per-second, providing greater system throughput. The maximum cable length is 12 meters, increasing flexibility in adding external storage devices. Ultra2 LVD SCSI supports up to 15 SCSI drive IDs. Customers who want to attach standard, Fast, or Fast Wide SCSI devices to the system along with Ultra2 LVD can add a PCI card offered by third-party vendors, but the bus speed will be slower.

Q. Does the Power Macintosh G3 (Blue and White) come with a modem?

A. The new Power Macintosh G3 comes standard with a built-in slot to accommodate a 56K modem that supports both the K56flex and V.90 standards. The modem is available as a build-to-order option via the Apple Store. Customers can also purchase external modems from third-party vendors.

Q. What version of the Mac OS does the Power Macintosh G3 (Blue and White) include?

A. The Power Macintosh G3 series ship with Mac OS 8.5.1. This version has lots of great new features and functionality. One of the highlights is Sherlock, your own private search detective. Sherlock is a powerful technology that lets you easily and quickly find information on local hard disk drives and the Internet.

Q. Is it possible to start up from a FireWire hard drive?

A. No, the boot ROM cannot currently support booting from FireWire-based storage devices.

TITLE

iMac: Sharing Files Via IrDA

Article ID: 58239
Created: 1/11/99
Modified: 1/11/99

TOPIC

How do I set up my iMac to communicate via infrared to another Macintosh computer?

DISCUSSION

First verify your computer supports IrDA by reviewing Article 20928: "[Macintosh Infrared: Is It IrDA Compatible?](#)".

If your computer is equipped with infrared technology that uses the IrDA protocol, you can establish a wireless TCP/IP or AppleTalk connection to a network using an IrDA network access device, or exchange files with another IrDA equipped computer.

Depending on the type of network protocol that you are going to use, choose Infrared Port (IrDA) from the "Connect via" pop-up menu in either the AppleTalk control panel or TCP/IP control panel.

AppleTalk Setup

In the AppleTalk control panel, select the Connect via option "Infrared Port (IrDA)." Close the window and save changes. **TCP/IP Setup**

Open the TCP/IP control panel.

Create an infrared configuration by selecting the Configurations option under the File menu, or press Command-K. Create a new set by selecting an existing set, duplicating it, and renaming it Infrared. Click Make Active. This step will make it easier to switch between IR, Ethernet, or other configurations later.

Select Connect via option "Infrared Port (IrDA)."

Enter an IP address and a default Subnet mask value as described in Article 30821: "[TCP/IP: Setting up a Private Network](#)". If you are switching the connection from an existing Ethernet network you can use the previous network values.

Example:

Computer 1:

- IP addr 10.0.0.1

- subnet mask 255.0.0.0

Computer 2:

- IP addr 10.0.0.2

- subnet mask 255.0.0.0

Close the window and save changes.

Establishing an IrDA Connection

To establish an IrDA connection, position your computer within three feet of the other computer or infrared network access device. IrDA devices that are in range will appear in the Infrared control panel.

Verify File Sharing is turned on and the appropriate volume is being shared. Review the setup in the Mac OS Help under "Sharing files with others on the network." You may now open your Chooser, select AppleShare and select the file server you wish to connect to.

Troubleshooting

If you are unable to enable IrDA, verify the following extensions and control panels are active by viewing them in the Extensions Manager control panel. If they are inactive, make them active and restart your computer. If they are missing, you will need to reinstall those components from your original system software CD.

Extensions:

IrDALib Extension

InLanScanner/PPC Extension

Control panels:

Infrared Control Panel

If the Infrared Port (IrDA) choice is not available

For PowerBook computers, make sure that IrDA is selected in the Options section of the Infrared control panel. The iMac will not have this choice, it will display Infrared built-in.

TITLE

About Your Ultra SCSI PCI Card

Article ID: 58245
Created: 1/14/99
Modified: 10/7/99

TOPIC

This article provides description and usage information for the Apple Ultra SCSI PCI Card for the Power Macintosh G3 (Blue and White), and the Power Mac G4 available as a Configure to Order option from the Apple Store at <http://www.store.apple.com>

DISCUSSION

Congratulations on purchasing the Apple Ultra SCSI PCI Card. This peripheral component interconnect (PCI) expansion card allows you to connect devices that use the Small Computer System Interface (SCSI, pronounced "skuh-zee"). SCSI is a standard method for connecting disk and cartridge drives, CD-ROM drives, scanners, and other devices. The SCSI port permits high-speed communication between the computer and SCSI devices.

Installing the Card

To install the card, you'll need to open your computer, install the card, then close the computer. For detailed instructions on installing PCI expansion cards, please refer to the documentation that came with your computer.

About SCSI Devices

Once you've installed the card and closed your computer, you can connect and use up to seven external SCSI devices with your computer. You connect external SCSI devices to the SCSI port on the card in a chain. The first device in the chain plugs into the SCSI port; the second device plugs into the first device, and so on.

Before You Connect a SCSI Device

Before you connect a SCSI device to your computer, follow the instructions in this section.

IMPORTANT This section contains general instructions for attaching SCSI devices to your computer. Also, follow the specific instructions that came with your SCSI device that tell how to change a device's ID number and attach a SCSI cable or terminator to the device.

Make Sure Each Device Has a Unique ID Number

Each external SCSI device connected to your computer must have its own unique ID number from 0 to 6. The SCSI ID number helps the computer keep track of the devices when several devices in the SCSI chain are communicating with the computer simultaneously.

The SCSI devices can be in any physical order in the chain; it is not necessary to arrange them in numerical order. See the instructions that came with each SCSI device for information on checking and setting its SCSI ID number.

IMPORTANT If you use two or more devices attached to the SCSI interface with the same ID number, your computer will not start up properly, your equipment may malfunction, and you may lose data as a result.

Use the Right Type and Length of Cable

To attach a SCSI device to your computer or to another device in the chain, always use SCSI cables that are double-shielded, such as Apple SCSI cables. Never use printer-type RS-232 cables (commonly used with DOS and Windows computers). Poor-quality SCSI cables are often the cause of SCSI problems. Avoid mixing brands and types of SCSI cables.

If the device is the first or only one you're connecting, use a SCSI system cable to connect it to the computer's SCSI port. If the device is not the first one, use a SCSI peripheral interface cable to connect it to the last device in the chain.

Keep the cables between SCSI devices as short as possible. Cables 18 to 24 inches long are best. PowerBooks and some SCSI devices

(particularly scanners) may not be able to handle cables longer than 24 inches.

IMPORTANT The total length of the cables in a SCSI chain should not exceed 6 meters (about 20 feet). SCSI cables must have a 110-ohm impedance.

Terminate the SCSI Chain Properly

To ensure accurate transmission of information, a terminator must be present at each end of a SCSI chain. One terminator, at the beginning of the SCSI chain, is inside your computer. When you connect external SCSI devices, make sure that only the last external device in the chain has a terminator.

IMPORTANT In almost all cases, only the first and last devices in the SCSI chain should be terminated, with one exception noted later in this section. Make sure that no external SCSI device but the last one has a terminator.

To terminate the last device in the chain, do one of the following:

- Use a device that has a built-in terminator as the last device in the chain. If you wish to attach two or more SCSI devices that have built-in terminators, an Apple-authorized service provider can remove the extra built-in terminators.
- If the device at the end of the SCSI chain does not have a built-in terminator, attach an external terminator. You can attach or remove external terminators yourself. (Do not use a black terminator; the black terminators are for Macintosh IIx computers and certain LaserWriter printers only.) Terminators are available at authorized Apple dealers.

IMPORTANT: Do not attach a terminator to a device that already has a built-in terminator. If you do, your computer may not start up properly.

Exception to the "first and last" rule: If the total cable length in the chain is greater than 10 feet, the chain may need a third terminator at the 10-foot point. Do not add the third terminator unless you are experiencing a SCSI problem, and check all other possible causes of the problem before adding the third terminator.

Connecting a SCSI Device

After you read the earlier section, "Before You Connect a SCSI Device," follow the instructions below. Use these general instructions in conjunction with the more specific instructions that came with your SCSI device.

1. Shut down your computer and make sure the SCSI device is turned off.
2. Connect one end of a SCSI cable to the SCSI port on your SCSI device.
3. Connect the SCSI adapter that came with your computer, shown below, to the other end of the SCSI cable.
4. Connect the SCSI cable with the adapter attached to the computer's SCSI port or to the last SCSI device already in the chain.
IMPORTANT Make sure the last device in the SCSI chain is terminated properly.
5. Turn on all devices in your SCSI chain. Then turn on your computer. **IMPORTANT** Always turn on all external SCSI devices connected to your computer before turning on the computer itself. Otherwise, your computer won't recognize that the SCSI devices are connected to it and your computer may not be able to start up.
6. Install any necessary device drivers (software that makes a device work with your computer).

Drivers needed for a SCSI device usually come on a floppy disk with the device. Some older SCSI devices may require updated drivers to work with your computer. For more information about drivers, contact the manufacturer of your SCSI device.

Note: If you experience problems after connecting a SCSI device, see the troubleshooting documentation that came with your computer or Mac OS Help for solutions.

Keep in mind:

- If you are not going to use a SCSI device and want to turn it off, disconnect the device from the existing SCSI chain of devices before turning the device off. If you turn off a device while others in the chain are still on, you may experience data loss or corruption, poor performance, or your computer may freeze.
- If you use different types of SCSI devices (such as SCSI-2 and Ultra SCSI) in the same SCSI chain, all devices will perform at the level of the slowest connected SCSI device.

Technical Specifications

- Operating system: Mac OS 8.5 or later
- System requirements: Power Macintosh G3 (Blue and White) and Macintosh G3 servers

..TIL58245-About_Your_Ultra_SCSI_PCI_Card.pdf

- Interface: One external, 50-pin Ultra Narrow SCSI connector
- Maximum data transfer rate: Up to 20 megabytes per second (MB/sec)
- Supports up to 7 SCSI external devices of the following types: SCSI-1, SCSI-2, Fast SCSI, Ultra SCSI
- SCSI ID number: Card uses SCSI ID 7

Note: While the Apple Ultra SCSI PCI Card is functionally equivalent to the Adaptec 2930 card, Apple has only tested, and therefore only supports the card using the external connector.

TITLE

Power Macintosh G3 and G4: Differentiating Between Available SCSI Cards

Article ID: 58256
Created: 1/21/99
Modified: 1/11/00

TOPIC

The Power Macintosh G3 (Blue and White) and Power Mac G4 have a number of SCSI cards available. What are the differences between them?

DISCUSSION

The three Apple SCSI cards available as configure-to-order options are as follows, with a shortened name in parentheses:

- Ultra SCSI PCI Card (Ultra)
- Single Channel Ultra2 LVD SCSI Card (Single)
- Dual Channel Ultra2 LVD SCSI Card (Dual) version 1 and 2

The version 2 dual channel SCSI card is functionally equivalent to the version 1 card, though it has been tested and approved for use with the Power Mac G4 (AGP Graphics) computer. Refer to the chart below for more specific technical information. The card is based on the ATTO ExpressPCI UL2D card. You may refer to the ATTO Web site at <http://www.attotech.com> for more information about the card.

Table 1 differentiates the various Apple cards based on their features. The Ultra card is best utilized for connecting slower, legacy SCSI-1 and SCSI-2 devices such as tape drives, hard drives, and scanners, as well as Ultra Narrow SCSI devices.

While there is some overlap among the cards, you should make your purchase decision based on what type of device you intend to connect to the card.

Specification	Ultra SCSI Card	Single Channel Card	Dual Channel Card version 1	Dual Channel version 2
Supported Computer	Power Macintosh G3 (Blue and White) and Power Mac G4	Power Macintosh G3 (Blue and White)	Power Macintosh G3 (Blue and White)	Power Mac G4 (AGP Graphics)
Max. Transfer Rate (MB/Sec)	20	80	80 per channel	80 per channel
Apple Supported Types	SCSI-1, SCSI-2 (Fast), Ultra Narrow	Ultra2 LVD	Channel A: SCSI-1, SCSI-2 (Fast), Ultra Narrow, Ultra Wide, Ultra2 LVD Channel B: Ultra2 LVD	Channel 1: SCSI-1, SCSI-2 (Fast), Ultra Narrow, Ultra Wide, Ultra2 LVD Channel 2: Ultra2 LVD
Internal Connector	50-pin standard (Male) (Not Apple Supported)	68-pin high-density Ultra2 (Female)	Channel A: 68-pin high-density Ultra2 (Female) Channel B: 68-pin high-density Ultra2 (Female), and 50-pin standard (Male) *	Channel 2: 68-pin high-density Ultra2 (Female)
External Connector	50-pin high-density (Female) Includes a high density 50-pin to DB25 adapter	68-pin high-density Ultra2 (Female)	Channel A: 68-pin high-density Ultra2 (Female) **	Channel 1: 68-pin VHDCI Ultra2 (Female)
Max. Devices Int/Ext	Up to 7 total	Up to 15 total	Up to 30 total	Up to 30 total

Maximum Cable Length Internal/External	3 meters w/non-Ultra devices; 1.5 meters w/Ultra devices or a mix of Ultra and non-Ultra devices	12 meters w/only Ultra2 LVD devices	Channel A: 3 meters w/non-Ultra devices; 1.5 meters w/Ultra devices or a mix of Ultra and non-Ultra devices; 12 meters w/only Ultra2 LVD devices Channel B: 12 meters w/only Ultra2 LVD devices	Channel 1: 3 meters w/non-Ultra devices; 1.5 meters w/Ultra devices or a mix of Ultra and non-Ultra devices; 12 meters w/only Ultra2 LVD devices Channel 2: 12 meters w/only Ultra2 LVD devices
PCI System Bus	32 bit	32 bit	64 bit	64 bit
Driver Compatibility	Compatible with SCSI Manager 4.3, and earlier drivers	Requires SCSI Manager 4.3 compliant driver	Requires SCSI Manager 4.3 compliant driver	Requires SCSI Manager 4.3 compliant driver

Table 1 Apple SCSI Card Specifications

* For maximum performance, the internal connector (Channel B) is recommended for Ultra2 devices only.

** The internal/external (Channel A) connectors are recommended for use with all SCSI types.

All three Apple SCSI cards allow you to boot your Power Macintosh G3 (Blue and White) from an attached device that has the appropriate system software installed.

Maximum throughput (Ultra2) is only possible when only Ultra2 devices are on the SCSI bus. When you connect a non-Ultra2 device to the single or dual channel card, the SCSI manager will negotiate with each device for maximum speed for that particular device.

Definitions

Additional definitions may be found at the following Web sites:

<http://www.seagate.com:80/support/disc/faq/scsirev.shtml>

<http://www.adaptec.com/tools/glossary/general.html>

Notes

1. The term Low Voltage Differential (LVD) can be used interchangeably with the term Ultra2.
2. High Voltage Differential, also known as Differential devices, are not supported.
3. With regards to the Ultra2 LVD SCSI cards, there are adapters to connect a Narrow device to the Wide bus, but this may leave a portion of the signal unterminated resulting in possible data transmission errors or data loss. Using such an adapter is not an Apple-recommended or supported solution.
4. Though Apple SCSI cards may be similar to certain Adaptec cards, use **only** Apple SCSI Card Firmware Updates on Apple cards. Do **not** use Apple Firmware Updates on Adaptec Power Domain cards. Similar firmware updates for Adaptec SCSI cards may be available from Adaptec.
5. For more information on the Apple Ultra SCSI PCI Card, see the following Tech Info Library article:
Article 58245: "[Power Macintosh G3 \(Blue and White\): About The Ultra SCSI PCI Card](#)"

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The following Tech Info Library article can help you search for a particular vendor's address and phone number:

TITLE

Apple Studio Display 17: Using With Older Power
Macintosh Computers

Article ID: 58271
Created: 2/3/99
Modified: 1/13/00

TOPIC

This article describes how to set up your Apple Studio Display 17" display to make the maximum number of resolutions available for use with older Power Macintosh computers.

DISCUSSION

If you are using any of the following computer models or graphics cards, you will need to turn off the DDC (Data Display Channel) control to make the maximum number of resolutions available.

- Power Macintosh 6100, 7100, and 8100 series
- PowerBook 1400 and 5300
- Power Macintosh 9500, 6200, 6300, and 6400 series
- some third-party video cards

For instance, if you are using any of the above computer models, or a third-party video card, and you are able to access only the 640 x 480 resolution setting, you will need to turn off the DDC control to access the rest of the resolution settings.

To turn off the DDC control:

1. Press the OSD Enter button on the left of the monitor. The main menu of the OSD, the Basic Adjustments menu, appears. This menu contains the seven main control icons of the On-Screen Display:

- Basic Adjustments
- Geometry
- Image
- Color
- OSD Adjust
- Language
- ETC

These icons represent controls that you use to adjust the picture and the On-Screen Display window.

2. To access a control, use the left or right arrow buttons to highlight icons. When the icon you want becomes highlighted, press the Enter button. Move the selection bar over the ETC icon and press the Enter button. Your choices are On or Off, select Off to disable DDC enabling more video resolutions to become available.

3. Press the OSD Exit button to leave the OSD function.

EXTENDED Information - Apple Internal Use - Service Providers and Support Professional

TITLE

Apple Studio Display 17: Removing Vertical Lines from Display

Article ID: 58272
Created: 2/4/99
Modified: 1/13/00

TOPIC

Upon setting up my Apple Studio Display 17", I noticed a number of thin vertical lines. How can I remove the lines?

DISCUSSION

The Diamondtron CRT used in the 17-inch Studio Display incorporates an aperture grid of very fine, vertical wires to enhance the sharpness of the image. Exposure to cold and or vibration can cause these fine wires to temporarily adhere to each other.

Note: Be careful not to confuse a vertical line with the horizontal stabilizing grid wires described in TIL Article 11497 "[Apple Color Monitors: Cause of Thin Horizontal Line\(s\)](#)". The horizontal wires are completely normal.

The vertical line anomaly is inherent to this type of display when exposed to lower temperatures and is not indicative of the need for a service call.

If your display is exhibiting visible thin vertical lines, you can most often break the adhesion between the grid wires by using the heel of your hand to moderately impact the side of your display under the Apple logo on the right, then left side. Using moderate force will not damage your display.

To avoid scratching or marring the external plastics, remove any jewelry or watches before you tap the display.

If the lines persist after a few attempts to break the adhesion of the wires, you should take the display to an Apple-authorized service provider for additional troubleshooting.

EXTENDED Information - [Apple Internal Use](#) - [Service Providers and Support Professional](#)

If a customer presents an Apple Studio Display 17" which continues to exhibit the thin vertical lines after a gentle tap with their hand, you may attempt to relieve the adhesion of the grid wires using a rubber mallet.

Note: If the customer calls, talk them through the above procedure before they bring the display to you for additional troubleshooting.

The display can be impacted at the center of the CRT, beginning with light force. You may increase the force applied with the mallet until you are approximately 12 inches from the face of the CRT. To avoid marring the face of the display, use only a solid rubber mallet and place a soft cloth over the CRT.

If the lines persist, you should contact Apple technical support for further troubleshooting instructions.

Do not replace any modules as this will not resolve the problem.

TITLE

Apple Studio Display 21: Using a USB PCI Card for
Troubleshooting

Article ID: 58302
Created: 3/23/99
Modified: 1/13/00

TOPIC

*** RESTRICTED: Apple Internal and Support Providers Only ***
Not For General Public Release

When troubleshooting an Apple Studio Display 21", it is acceptable to use a USB PCI expansion card if you do not have a Power Macintosh G3 (Blue and White) to connect the Apple Studio Display to. The following information has been added to the Service Source CD.

DISCUSSION

ADDED TO BASICS CHAPTER

Extended Compatibility for Service

At introduction in January 1999, the Apple Studio Display (21" CRT, 19.8" VIS) worked only with the USB-based Power Macintosh G3 (Blue and White). This configuration is still the only approved configuration for customers. However, service providers may service the display using one of the Power Macintosh computers listed below, running Mac OS 8.5 or later, with a Keyspan USB card installed in a PCI slot.

ADDED TO TROUBLESHOOTING SYMPTOM CHART

Important: Although this configuration is not approved for customers, the display can be serviced using one of the Power Macintosh computers listed below, with a Keyspan USB card installed in the PCI expansion slot. Other third-party USB cards have not been tested with this display.

To properly set up the display to work with one of the following Power Macintosh computers:

1. Install Keyspan USB card in a PCI expansion slot. **Note:** You can obtain additional information on the Keyspan USB card at their Web site: <http://www.keyspan.com>
2. Perform a clean installation with Mac OS 8.5 or later.
3. Install Apple Displays Software 1.7 or later.
4. Install USB driver 1.1 (called Mac Installer) from disc that comes with Keyspan USB card.

Due to a bug, the USB Display Service Utility v1.1 will not run on Power Macintosh G3 Desktop or Power Macintosh G3 Minitowers. However, it does run on the following PCI-Based Power Macintosh computers:

Power Macintosh 4400
Power Macintosh 6400
Power Macintosh 6500
Power Macintosh 7200
Power Macintosh 7250
Power Macintosh 7300

Power Macintosh 7350
Power Macintosh 8500
Power Macintosh 8550
Power Macintosh 8600
Power Macintosh 9500
Power Macintosh 9600
Power Macintosh 9650
Power Macintosh G3 (Blue and White)

This problem will be fixed in the next version of the USB Display Service Utility.

TITLE

PowerBook G3 Series (Bronze Keyboard): Upgrading
Memory

Article ID: 58325
Created: 5/6/99
Modified: 12/21/99

TOPIC

This article provides the necessary information for upgrading memory in the PowerBook G3 Series (Bronze keyboard) computer.

DISCUSSION

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, please see the following Tech Info Library article:

Article 24604: "[PowerBook G3 & G3 Series: Identifying Different Models](#)"

For information on upgrading memory in a PowerBook G3 Series computer, see the following Tech Info Library article:

Article 25002: "[PowerBook G3 Series: Upgrading Memory](#)"

The PowerBook G3 Series (Bronze keyboard) uses the same memory as the PowerBook G3 Series and iMac, with a maximum of 384 MB supported. There are two available slots for memory upgrades. The 128 MB configuration from Apple may use one-128 MB module or two-64 MB modules. Before ordering memory, ensure you have an available memory slot.

To verify your current memory configuration, open Apple System Profiler and click the System Profile tab. In the Memory Overview under the Built-in memory arrow it will describe how the Bottom and Top memory banks are configured.

Note: These directions are also available under the Help menu in the Help Center. Select the About Your PowerBook guide and refer to the Installing Memory section.

To upgrade the memory in your computer, follow these steps:

1. Remove AC power and the main battery.
2. Remove keyboard by first releasing the screw behind the port access door on the back of the computer. Turn the screw 7 to 8 times counter-clockwise to release it.

Note: Apple does not ship the PowerBook with the keyboard locking screw engaged. As such, it may or may not need to be released prior to keyboard removal.

The screw will not come out of the computer. Once the screw is released, slide the two release latches along the function key row towards the front of the computer to release the keyboard. Roll the keyboard towards you and rest it over the trackpad.

3. Remove the three screws holding the heatsink to the processor. Use caution when removing the heatsink as the material on the processor may stick to the heatsink. Lift the front edge of the heatsink first, then remove it completely from the computer.

4. Install the memory card. When installing the memory, start at a 30 degree position and then push the memory card in and down slightly. You will feel a slight snap as the card locks into position.

5. Reinstall the heatsink being careful not to damage clip holding the RAM card to the processor card. Refer to TIL article 58405: "[PowerBook G3 Series \(Bronze keyboard\): Heatsink Reinstallation Tip](#)" for additional information on reinstalling the processor heatsink.

6. Reinstall the keyboard, again sliding the release latches back to allow the keyboard to be secured to the computer. Retighten the keyboard locking screw to secure the keyboard to the computer.

Note: When reinstalling the keyboard, make sure all the tabs on the leading edge are fully inserted into the corresponding slot. Failure to do so may cause the keyboard tab to put pressure on the CD-ROM drive possibly causing a grinding noise when resting your hand on the palmrest when a CD is inserted.

7. Turn the computer on and choose About This Computer from the Apple menu to ensure the memory is recognized.

Note: Care should be exercised when installing memory as this exposes components that are static sensitive. Use a grounded work area to discharge any static electricity on your body before handling memory. Damage caused by static electricity will not be covered by the Apple Limited Product Warranty.

TITLE

PowerBook G3 Series (Bronze Keyboard): Information
About NewWorld ROM

Article ID: 58342
Created: 5/6/99
Modified: 12/21/99

TOPIC

I understand the PowerBook G3 Series (Bronze keyboard) uses the ROM-in-RAM (NewWorld ROM). What is it and what does it mean to me?

DISCUSSION

This PowerBook is different from previous Macintosh PowerBook computers in that it has no single, large physical ROM that contains many components of the Mac OS, the 68K emulator, hardware initialization, and the nanokernel. Instead, a small physical ROM provides hardware initialization functions and provides a mechanism to load the Mac OS ROM image into RAM. The new software architecture that is centered around ROM-in-RAM and its ramifications has the code name NewWorld.

ROM-in-RAM

Hardware-specific code resides in firmware (ROM) that fits into one ROM called the boot ROM. The boot ROM includes the code and tables needed to start up the computer, load an operating system, and provide common hardware access services.

All higher-level software resides in what has been historically known as the Mac OS ROM, but with much of the old hardware-specific code moved into the boot ROM. As before, the Mac OS ROM can still be augmented by enablers, the System file, and extensions.

Prior to the iMac, all Macintosh computers required a ROM component that contained many components of the Mac OS software. The ROM-in-RAM approach sidesteps this requirement by copying an image of the Mac OS ROM into RAM before the Mac OS begins operation. Once the Mac OS begins operation, a Mac OS ROM image in RAM and an actual Mac OS ROM behave in the same way. No new or different software interfaces are directly accessible from the Mac OS. During the boot process, software contained in the Mac OS ROM file communicates with Open Firmware to collect information about the hardware, using the Open Firmware Client Interface.

Performance

Performance of a PowerBook computer using ROM-in-RAM should exceed performance measurements for other Macintosh computers with comparable microprocessors and speeds due to the improved interrupt handling with the ROM-in-RAM approach. In addition, performance is improved because code that used to exist in ROM is now in RAM and RAM chips operate faster than the ROM chips.

RAM Footprint

Because the Mac OS ROM image is stored in RAM, approximately 3 megabytes of RAM is removed from availability for other uses. In effect, a system with 64 megabytes of RAM appears to have only 61 megabytes available. Some portion of the missing 3 megabytes is offset by having fewer patches in RAM.

Data Structures and Files

The Mac OS ROM image is contained in a new file, named "Mac OS ROM", that is kept in the System Folder. The Mac OS ROM image is exactly the same as it would be if it were an actual Mac OS ROM, containing the high-level software, the kernel software, and the 68K emulator.

Startup Disk Control Panel

Previous systems stored the user's selected startup device in PRAM when the user selected a device in the Startup Disk control panel. This device was honored by the Mac OS ROM unless the selected device was unavailable or was overridden by the user. The startup disk routine for the PowerBook computer, rather than setting Mac OS PRAM, sets an Open Firmware config variable called boot-device. This setting is honored by Open Firmware unless the selected device is unavailable or is overridden by the user.

Pressing the following keys during the startup sequence can be used to override the selected startup device.

Command-Option-Shift-Delete: will ignore the device that is selected in the Startup Disk control panel.

C: force the internal CD-ROM drive to be the startup device

D: force the internal hard disk to be the startup device.

Open Firmware and Startup Devices

In order for a device supported by an expansion card (for example a SCSI PC card) to participate in the startup process (for example, to boot a drive connected to that SCSI PC card), the card must include an expansion ROM containing startup firmware. Expansion cards for startup devices must contain all the driver code required during startup in the expansion ROM on the card. Depending on their functions, such cards may also need to provide support resources such as fonts.

Examples of devices needed during system startup include display, keyboard, and mouse devices, and storage devices such as hard drives and CD-ROM drives.

Important: If Open Firmware code is not included in the expansion card for a startup device, the card will not be usable until the operating system loads its supporting software from disk after the startup process has concluded.

TITLE

PowerBook G3 Series (Bronze Keyboard): Read Me

Article ID: 58354
Created: 5/10/99
Modified: 12/21/99

TOPIC

This article comprises the PowerBook G3 Series (Bronze keyboard) Read Me.

DISCUSSION

Important Information About Your Macintosh PowerBook

This document provides late-breaking news about your Macintosh PowerBook G3 Series computer. You may want to print this document to keep with the user's manual for your PowerBook.

Important Information About Your Hard Disk's Format

Using Hard Disk Utilities and Disk Locking Programs Some disk utility and disk locking programs are incompatible with Mac OS Extended format. Before you attempt to use a disk utility or disk locking program, make sure the version you have is compatible with Mac OS Extended format. Check the documentation that came with the program or contact the manufacturer or the vendor that supplied the program.

Important Information About Reinstalling System Software

Your computer came with all necessary system software already installed. However, if you use the Mac OS Install program to reinstall your system software you will need to install certain items from the CD separately. These items are located in a folder titled "Important Extra System Software"

To install the extra system software:

1. After reinstalling the Mac OS, drag and drop the items from the folder on top of a closed system folder on your hard disk.
2. Click OK when asked to put the items in their proper location.
3. Restart your computer.

Important Information About Your Battery

Your battery has external indicator LEDs that let you monitor the charge level of your battery. Before the LEDs will report levels correctly, the battery must be fully discharged and recharged to calibrate the battery. After this calibration, the LEDs will report charge levels properly.

Important Information About Computer Sleep

When Using IrDA When the IrDA method of infrared (IR) communication is selected in the AppleTalk control panel and AppleTalk is on, the computer will not go to sleep automatically.

When Using a Communications Program

Many communications programs, such as PPP, Apple Remote Access, or other dial-up programs, monitor the computer's modem port to check for incoming transmissions. This may mean that the PowerBook will not sleep automatically (after the interval set in the Energy Saver control panel). Forcing sleep while connected may result in a lost connection or crash. When your computer is using the battery, you may want to quit a communications program whenever you are not using it to conserve the battery's charge. (See the manual that came with your communications program for more information.)

When Using Fax Software

Your computer will not completely sleep and the screen will only dim (instead of turn off) when fax software is set to auto answer. To avoid draining your computer battery, plug in the power adapter when waiting to receive a fax.

When FAXstf is set to answer a fax automatically, your computer will not sleep automatically. To enable the Auto sleep function in FAXstf, select Settings from the Edit menu, choose the "Fax Modem" icon, and select Never from the pop-up menu.

Waking From Sleep and the CD-ROM or DVD-ROM Drive

There is a period of time when waking from sleep that the CD-ROM or DVD-ROM drive will allow you to manually eject a mounted disc using the button on the drive tray. This will cause unexpected behavior. Closing the tray will correct the situation.

Important Information About SCSI Disk Mode

SCSI Disk Mode

The software needed to SCSI Disk Mode, is now included in the Mac OS ROM file located in the System folder. Your PowerBook cannot operate in SCSI disk mode if the System Folder is damaged or missing. Repair your System Folder by starting up from the PowerBook CD that came with your computer and reinstalling system software.

PowerBook SCSI Setup control panel

The PowerBook SCSI Disk Mode control panel has been renamed PowerBook SCSI Setup because it includes a new feature that allows the ability to wake from sleep faster.

Setting the SCSI ID

When you use your PowerBook in SCSI Disk Mode, the SCSI ID of the PowerBook will be set to #2, regardless of the ID you set in the PowerBook SCSI Setup control panel. When setting up your PowerBook for SCSI Disk mode, make sure that no other devices use SCSI ID #2.

SCSI Disk Mode and Battery Power

Always connect the power adapter when operating in SCSI Disk mode. Low battery conditions are not reported and data loss could occur if the battery gets completely drained.

Important Information About Networking

Connecting to a 10/100Base-T network

When you connect your PowerBook to an Ethernet network, the computer automatically senses whether it is connected to a 10Base-T network or to a 100Base-T network. Some (possibly all) ports on some network hubs/switches support both speeds. If you're using this type of hub/switch, there may be a delay in establishing a network link. The delay may last for several seconds after you start or restart the PowerBook and a message may appear saying the network is not available or that the network has only just become available. If you don't want a delay, connect your computer to an Ethernet network port that is not auto-sensing (10 or 100 megabits per second (Mbps) only). For more information, contact the manufacturer of the Ethernet hub/switch or your network administrator.

Performance Problems Using Ethernet

If you experience performance problems on your Ethernet network, check with your network administrator. Your computer performs best when the Ethernet port that it is connected to is set to auto-negotiate.

Important: The duplex mode of an Ethernet link to a hub is not detected if the hub's port is not auto-negotiating. If the hub's port is not auto-negotiating, your computer will detect the appropriate speed but default to half-duplex. If the hub's port at the other end of the link is configured for full-duplex, a large number of late events can occur on the link. Set the hub's port to auto-negotiate where possible. If this isn't possible, then set the hub's port to half-duplex. For more information, see the documentation that came with the Ethernet hub.

Important Information About Displays

When connecting an Apple Studio Display monitor with a USB cable to your PowerBook, be sure to connect the monitor's USB cable to the USB port (on the back panel of the computer). The AppleVision software requires this connection.

If you have an older AppleVision or Apple Studio Display monitor that has an ADB type cable you will be unable to attach the ADB cable to your PowerBook. In order to adjust the screen image you will need to use the external controls on the monitor. For more information see the documentation that came with your monitor.

When using an Apple 15" MultiScan, Apple 1705 MultiScan or an AppleVision 1710AV monitor, the PowerBook display should be set to turn off rather than dim. If the computer is set to dim, the external display may behave erratically. To set the display:

1. Open the Energy Saver control panel
2. Click on "Advanced Settings"
3. Check "Turn off the PowerBook display instead of dimming it."

Important Information About Operating With the Display Closed

When operating with the display closed and an external monitor attached, you must have the PowerBook connected to the power adapter. Display closed operation while running on battery power is not supported.

Important Information About Your Expansion Bays

Booting from Expansion Bay devices If the system folder on your internal hard drive is invalid and you need to boot from an expansion bay module, be sure the module is inserted prior to booting or restarting your computer. If you insert the module after booting, you will see a blinking question mark or blinking folder icon. This is not recommended as unexpected results may occur.

Important Information About the Internal Modem

The modem used in the PowerBook G3 Series is a 56K modem based on the new V.90 specification. Any time a new modem standard is introduced there is a period of adjustment while various Internet service providers (ISPs) work to ensure that their POP (Point-of-Presence) servers are compatible with the new specification.

If you're having problems connecting in V.90 mode--if the modem won't connect at all, or the connection is dropped after a few minutes--it may be because the phone lines are too noisy or there's too much interference to sustain a connection of speeds above 33.6 kilobits/second (Kbps). Contact your ISP to ensure they are currently using V.90-compliant modems, or have plans to update to them in the near future. Use the PowerBook G3 Series Internal 56K (V.34 Only) modem script, which forces the modem to connect at 33.6 Kbps or lower speeds. This type of connection is more reliable in situations where the phone line quality is questionable.

To use the PowerBook G3 Series Internal 56K (V.34 Only) option, follow these steps:

1. Open the Modem control panel in the Apple menu.
2. Make sure the "Connect via" pop-up menu is set to Internal Modem.
3. Open the Modem pop-up menu and choose "PowerBook G3 Int56K (v.34 Only)".
4. If necessary, set the Sound and Dialing options.
5. Close the control panel. A message asks if you want to save the changes to the current configuration.
6. Click Save. **Note:** You do not have to restart your computer in order to use the new modem software.

Important Information About Startup Disk Devices

Be sure a valid startup disk is selected in the Startup Disk control panel. If an invalid startup disk is selected, your computer could take as long as 2 minutes to locate a volume that it can startup from. PC Card devices and RAM disks are examples of devices that are not valid to start up from, even though the icon may be displayed in the Startup Disk control panel.

Selecting the Network Disk icon in the Startup control panel without having a Netboot server properly setup will also significantly delay the time it takes you PowerBook to boot up.

Your computer cannot startup using an external USB device.

Important Information About Using A Television With Your PowerBook

The online Help incorrectly states that you can turn TV Mirroring on and off from the control strip. TV Mirroring should turn on automatically after you wake or start up the computer. To turn it off, sleep the PowerBook and then disconnect the video cable from the back panel of the computer.

Important Information About Viewing DVD Video

For best performance when viewing a DVD video:

- Turn off virtual memory in the Memory control panel.
- Turn off file sharing in the File Sharing control panel.

- Make sure that the disk cache is to the default setting in the Memory control panel.
- Quit all other applications.

Important Information About Third-Party Hardware

About drivers for USB input devices To run a USB device on a Mac OS-based computer, the device needs a software program called a "driver," available from the manufacturer of the device. Drivers appear as extension files stored in the Extensions folder within the System Folder. Apple already includes drivers in the Mac OS for USB mice, keyboards, hubs, game devices, and Iomega's USB Zip drive. Drivers for other devices, such as Epson and Hewlett-Packard printers, are included on the software install CD that came with your computer. These drivers can be found in the CD Extras folder, within the USB Device Drivers folder. After you install the driver software, you should be able to use the device. If you have problems, please contact the manufacturer of the device. From time to time, new versions of USB drivers become available. For up-to-date information on driver software, contact the manufacturer of the device.

Check the documentation that came with the device for installation instructions or contact the manufacturer or the vendor that supplied the device.

Some USB devices may not work with Mac OS until Mac OS drivers are made available. For information about the compatibility of a USB device with Mac OS, contact the manufacturer of the device.

Some applications don't recognize USB devices if the devices are plugged in while the application is running. To use the USB device with that application, quit the application, make sure the device is properly plugged in, then start the application again.

Using ADB Dongles

Some applications require the use of an ADB (Apple Desktop Bus) dongle for security purposes to prevent software piracy. The PowerBook now uses Universal Serial Bus (USB) technology. You may be able to use a USB dongle with these applications. For more information, contact the software manufacturer.

Using USB-to-Serial Converters

Some serial devices such as modems, printers and digital cameras may be able to be used with your PowerBook using a third-party USB-to-Serial converter adapter. However, all serial devices will not necessarily be compatible with such an adapter. For more information, contact the adapter manufacturer.

Using files on USB Storage devices

When working with files on an external USB storage device, always quit any open applications that may be using a file on the device before you sleep your PowerBook or disconnect the device. Unexpected results may occur, including the possibility of corruption of the media within the USB device. Contact the vendor of the specific USB device for more information.

Important Information About Installing Help For Your Computer

Your computer came with additional Help files specific for your model of computer. These files are already installed on your hard disk and available in the Help Center. This installation program will reinstall the Help files specific for your model of computer.

Reinstallation of these Help files is only necessary if you performed a clean installation of this or future versions of the Mac OS system software and your computer specific Help files are missing from the Help Center. The installation program for these computer specific Help files is located in the CD Extras folder on your PowerBook G3 Series CD.

Important Information About PC Cards

Your computer has a manual PC Card eject mechanism. To eject a PC Card, drag the card's icon to the trash and then use the PC Card eject button to eject the card. This is different from previous PowerBooks where dragging the icon to the trash would cause the card to be ejected from the slot.

Important Information About a RAM disk

The RAM disk cannot be used as a startup disk. If you create a RAM disk, its icon will not be displayed in the Startup Disk control panel.

The contents of a RAM disk are saved to the startup drive when you restart your computer. The contents are restored, once the computer restarts. Large RAM disks may add additional time to shutting down and restarting the computer.

Warning: The contents of the RAM disk can be lost if:

- the startup drive is read-only, such as a CD-ROM disc
 - the startup drive does not have sufficient space to store the contents of the RAM disk
 - the startup drive does not have a valid System Folder
 - the computer loses power
-

TITLE

Troubleshooting a CD-ROM or DVD-ROM Disc That
Will Not Mount

Article ID: 58382
Created: 5/17/99
Modified: 11/22/99

TOPIC

This article provides steps for troubleshooting a CD or DVD disc which will not mount to the desktop.

DISCUSSION

Prior to troubleshooting, verify the following:

- Whether you have a DVD or CD drive. Using Apple System Profiler, click the Devices and Volumes tab, or read the label on the drive itself. If the drive is DVD capable, it will say DVD on the label. DVD drives require specific driver software to function properly.
- Make sure the appropriate extensions are installed and active in the Extensions Manager. (Apple CD/DVD Driver, Foreign File Access, UDF Volume Access).
- Make sure the disc is inserted in the proper orientation; the label should be facing up. Some DVD discs are double-sided so try the other side if double-sided. Be sure the disc is fully seated in the drive tray.

Note: If your CD/DVD-ROM drive has recently been replaced, try updating the CD/DVD-ROM driver located in the extensions folder within the System Folder. The driver can be reinstalled from the system software CD that came with the computer, or downloaded from the Apple Software Updates web site at **<http://www.apple.com/swupdates>**.

Once you have verified the above conditions, follow these steps:

1. Hold down Command-Option-i when closing the drive door. This will attempt to mount the disc as an ISO formatted disc instead of the UDF format. Continue to hold these keys down until the disc mounts. If disc does not mount within 30 seconds, proceed to the next step.
2. Try another CD or DVD disc. If another disc works, try cleaning the problematic disc with a cleaner and try that disc again.
3. For PowerBook computers, make sure the computer is powered off, then eject and reinsert the CD-ROM drive mechanism. For Power Macintosh computers try reseating the cables to the back of the CD-ROM drive and try the disc again.
4. Restart computer and reset PRAM, and then try disc again. Refer to TIL Article 2238:
Macintosh: How to Reset PRAM and NVRAM
5. Use the System Software CD that came with the computer to reinstall the CD/DVD software. Restart the computer and try the disc again.
6. For PowerBook computers, try another drive if available. If not, the PowerBook will require service by an Apple Authorized Service Provider. If another drive works, call an Apple Authorized Service Provider to receive a replacement drive. For Power Macintosh computers, contact an Apple Authorized Service Provider to have the computer serviced.

For further information on this topic see the following articles:

TIL Article 30878: **DVD Discs: Not Mounting and/or No Sound**

TIL Article 20799: **PCI-Based Macintosh Computers: Won't Mount CD-ROM**

EXTENDED Information - [Apple Internal Use](#) - [Service Providers and Support Professional](#)

When you replace a CD/DVD ROM drive, verify whether you are replacing it with a like speed drive. If the drive is faster, it may not read

certain CDs. If it fails to read some CDs, update the CD/DVD drivers using Apple CD-ROM Software. You download the current CD-ROM software from the Apple Software Updates web site at <http://www.apple.com/swupdates>.

TITLE

PowerBook and iBook: Troubleshooting a Dead Unit

Article ID: 58385
Created: 5/17/99
Modified: 1/5/00

TOPIC

This article provides troubleshooting steps for a PowerBook or iBook computer that appears dead, or otherwise non-functional, with either a battery or AC power.

DISCUSSION

1. Remove any peripheral devices from the computer.
2. Remove AC adapter and battery from the PowerBook or iBook and reset the power manager. For more information on resetting the power manager, refer to TIL article 14449: "[PowerBook: Resetting Power Manager](#)".
3. Verify the outlet is working and all connections are tight. Connect the AC adapter to a known good power outlet and make sure power adapter cord is fully inserted into the power adapter. Ensure you are using the AC adapter which was designed for use with your computer. Refer to TIL article 16168: "[PowerBook: Battery, Recharger & AC Adapter Identification](#)" for help identifying the appropriate power adapter.
4. Connect the AC adapter to the PowerBook or iBook, wait a few seconds, and then press the power on button. If the unit powers on, it is likely that you have a bad battery. If you have another battery you should try it, if you do not, have your computer serviced. If the computer did not power on with the AC adapter connected, go to step 5.
5. Remove the AC adapter, insert a charged battery, and try the power on button again. If the computer powers on, you most likely have a bad AC adapter. You should contact Apple for a replacement. If the computer does not power on, proceed to step 6.
6. If problem continues, it is likely that your computer has a hardware failure that will require a repair.

Note: The PowerBook G3 Series battery has a series of LEDs that indicate the charge level when you press the small button. If only one LED is flashing, or no LEDs are on, the battery is depleted and needs to be charged.

TITLE

Power Macintosh G3: DVD Troubleshooting

Article ID: 58402
Created: 6/7/99
Modified: 1/25/00

TOPIC

This article provides troubleshooting information for a variety of issues which may arise when playing DVD video. This information is mainly directed at the Power Macintosh G3 computers though general DVD troubleshooting is still relevant to other DVD-ROM capable computers.

DISCUSSION

Video Stutter During Playback of a DVD Movie

There are a number of possible causes for stutter when playing back a movie. Stutter is defined as a momentary pause in playback, either sound or video could be affected.

Possible causes are:

- Virtual memory is turned on.
- Speech or other background processes/applications can also cause stutter. Quit all other applications when viewing DVD video.
- The disc could be switching layers.
- The disc may be dirty. Try cleaning it with a soft cloth.

"Cannot find required hardware" Error Message

This error can occur when either the appropriate hardware is not detected, or if the appropriate software components are not detected. Refer to TIL article 30887: **Power Macintosh G3 (Blue and White): Apple DVD Player Cannot Open** for troubleshooting tips.

Pixelation in Dark Areas

- Set the Bit Depth to Millions in the Monitors & Sound control panel.
- Switch resolution to 800 x 600 or 720 x 480 if available (only when connected to an external display).
- Choose normal size as opposed to full screen for the best quality image.
- Select best for video when watching on S-video device such as a television.

Low Sound Volume

- Check preferences and make sure Line In audio is not selected.

No Sound

- Make sure the Sound In source in the Control Strip is set to DVD.
- Try changing the sound setting when playing the movie by selecting the audio button on the DVD Controller.

Stops at Opening Window

- Press Return key and wait a few seconds. If the video has not started, press the spacebar.

Some Items in the Menu Are Not Able to be Selected

- Try using the arrow keys and the return key.

The DVD Disc Box Says "The DVD-ROM features will not work on a CD-ROM or a Macintosh computer."

Many features, including the ability to play the movie, are still available when using the Apple DVD player. Only features that require

..TIL58402-Power_Macintosh_G3_DVD_Troubleshooting.pdf

additional software to be installed will not be available. For the most part, those features are likely to have software written for a Windows environment.

Movie Does Not Immediately Start

It will take a moment for the movie to load. The system software is accessing necessary information to decode the movie. It is completely normal and not indicative of any hardware or software failure.

TITLE

PowerBook G3 Series (Bronze keyboard): Heatsink
Reinstallation Tip

Article ID: 58405
Created: 6/10/99
Modified: 6/10/99

TOPIC

This article provides an important tip when reinstalling the processor heatsink in the PowerBook G3 Series (Bronze keyboard).

DISCUSSION

When reinstalling the heatsink, for example after a memory upgrade, be sure that the ferrite bead on the display cable is not under the heatsink. If the ferrite bead is under the heatsink, the EMI gasket and ferrite bead will stack up possibly causing a slight bow in the keyboard after reinstallation.

Before screwing the heatsink down, gently push the ferrite bead towards the rear of the PowerBook creating the necessary clearance for the heatsink.

TITLE

PowerBook G3 Series (Bronze Keyboard): Reattaching
I/O Door Spring

Article ID: 58408
Created: 6/30/99
Modified: 12/21/99

TOPIC

*** RESTRICTED: Apple Internal and Support Providers Only ***
Not For General Public Release

This article provides directions for reattaching the I/O door spring on a PowerBook G3 Series (Bronze keyboard). This article will be helpful if the door is still fully on its hinges but it no longer has any spring action, either opening or closing, and it cannot be fully closed.

DISCUSSION

The root cause of the problem is that one of the door's legs, usually the right one, pops off its spring when the door is bent during use. Typically this happens when an object, or the user's hand, catches the bottom of the door near the middle, causing it to bow out and pull the end of the leg off the spring.

1. Grasp the I/O door near the middle between your thumb and forefinger.
2. Gently and slowly pull the door out from the unit, making sure you are pulling both the top and bottom of the door evenly. You should be able to see a thin, crescent-shaped gap appear between the door and the I/O wall. It's important to pull the bottom of the door out evenly with the top.
3. When you've pulled the door out 5 to 10 millimeters (0.2 - 0.5 inches) from the I/O wall, you'll hear, and feel with your fingers, a small pop. Also, you will notice at that moment, the right side hinge pin in the door will pop out slightly (approximately 1-2 mm). Do not pull the door out any further, proceed to the next step.
4. While still holding the door in your fingers, rotate it to the closed position and let it relax back into place. You will hear another pop as the spring goes back into its proper position.

The door should now operate correctly and close fully. Open and close it a few times to make sure.

TITLE

Power Mac G4: Select a Startup Disk to Reduce Start Up Time

Article ID: 58421
Created: 8/31/99
Modified: 1/11/00

TOPIC

Is it necessary to select a startup disk from within the Startup Disk control panel? I did not do it and it seems to take quite a long time for my Power Mac G4 to start up.

DISCUSSION

Power Macintosh computers that use the ROM-in-RAM (otherwise known as New World) architecture, such as the Power Mac G4, will take longer to start up unless the drive that contains the active system folder and the Mac OS ROM file is selected in the Startup Disk control panel.

If you do not have a drive selected there, the computer has to scan through all the available interfaces where a start up device can be found, including SCSI (if installed), IDE, any network port, and USB. This takes some time to do, so the length of time to start up the computer is extended.

All you need to do is select the appropriate disk in the Startup Disk control panel, on the next restart you should notice an reduction in the amount of time it takes to start up your computer.

TITLE

Power Mac G4 (AGP Graphics): Supports Power Manager 2.0

Article ID: 58422
Created: 8/31/99
Modified: 1/5/00

TOPIC

What is PCI Power Down mode and how does it relate to Power Manager 2.0?

DISCUSSION

In an effort to continually reduce the environmental impact of our products, the new Power Mac G4 (AGP Graphics) provides a method to turn off power to PCI interface cards after a pre-determined amount of time. Since the cards are turned off, the system fan can also be turned off providing further power saving benefits. This functionality, referred to as PCI power down mode, is provided as part of Power Manager 2.0.

Not all PCI cards support this mode however. If you have an older PCI card installed that does not support Power Manager 2.0, the PCI bus will not power down and the system fan will continue to run. Because of this, maximum power savings will not be realized. All cards installed must support PCI power down mode or the computer will not enter that mode.

Check with the vendor of the PCI card to determine if it supports this mode or can be upgraded to do so.

Note: The Apple Ultra SCSI card has been revised to provide Power Manager 2.0 compliance. The revised card was implemented in Power Mac G4 (AGP Graphics) models built after October 31, 1999.

TITLE

Power Mac G4: Description of Velocity Engine

Article ID: 58427
Created: 8/31/99
Modified: 1/5/00

TOPIC

This article describes the Velocity Engine, also known as AltiVec, which is incorporated into the new PowerPC G4 processors in the Power Mac G4 computer.

DISCUSSION

The Velocity Engine can process data in 128-bit chunks, instead of the smaller 32-bit or 64-bit chunks used in traditional processors (it's the 128-bit vector processing technology used in scientific supercomputers--except that we've added 162 new instructions to speed up computations). In addition, it can perform four (in some cases eight) 32-bit floating-point calculations in a single cycle--2-4 times faster than traditional processors.

The PowerPC G4 with Velocity Engine works with the PowerPC architecture to accelerate the data-intensive processing required by next-generation video, voice, and graphics applications. Among the G4 key features is a vector permute function capable of rearranging data in the registers--a priceless benefit when converting data from one format to another (often necessary with voice, video and graphics apps, which typically need to save data in a number of different formats). These vector processing acceleration advantages give the G4 microprocessor a significant edge when it comes to fast visualization of large data sets, and intensive math for real-time simulations. Making the G4 perfect for everything from graphics and 3D games to astronomy, the biosciences, and predictive modeling.

For an in-depth discussion of the technology, refer to the Motorola Web page on AltiVec at <http://www.mot.com/SPS/PowerPC/AltiVec/index.html>.

TITLE

Power Mac G4 (AGP Graphics): Ethernet and Wireless
Networking Specifications

Article ID: 58431
Created: 8/31/99
Modified: 1/11/00

TOPIC

This article provides the specifications for the Ethernet and wireless networking capabilities of the Power Mac G4 (AGP Graphics).

DISCUSSION

The Ethernet controller on the Power Mac G4 (AGP Graphics) is similar in function to previous 10/100 Megabit Ethernet controllers Apple has used. The main difference is with the controller itself. Apple originally used a DEC 21143 chipset for Ethernet. Ethernet and FireWire has since been rolled into the Uni-N chipset. Because it is a different hardware controller, you should only use Ethernet drivers that came with the Power Mac G4 (AGP Graphics) and not any versions from previous Macintosh computers.

Some of the other specs for the onboard Ethernet are:

- IEEE 802.3 compliant
- Maximum cable length: 100 meters (m)
- Open Transport, Mac OS 8.5 or later, AppleShare, AppleTalk, NetWare for Macintosh, TCP/IP
- Connector: RJ-45 for 10Base-T and 100Base-TX
- Media, 10Base-T: Category 3 or better UTP on 2 pairs up to 100 m
- Media, 100Base-TX: Category 5 UTP on 2 pairs up to 100 m
- Channel speeds: IEEE Auto Negotiation of 10Base-T and 100Base-TX

About Wireless Networking

The Power Mac G4 (AGP Graphics) supports wireless networking using the optional AirPort Card. To participate in wireless networking, you need the following items:

- Internal radio antenna - The radio antenna necessary for wireless networking is already installed inside your computer.
- AirPort Card - This small card (about the size and shape of a credit card) is installed in the wireless networking slot inside the computer. If your computer did not come with an AirPort card, you can purchase one from your Apple-authorized dealer or from The Apple Store at <http://www.apple.com/store>.
- Wireless network access point - To use your computer's wireless capabilities to access a computer network or Internet service provider, you need to connect a wireless access device to your network. This access device can be an AirPort Base Station (a standalone box with a wireless antenna and network and modem connections) or an AirPort Software Access Point (software running on a wireless-equipped computer).

Specifications for optional AirPort Card

Wireless Data Rate - 11 megabits per second (Mbps) maximum with fallback to 5.5, 2, and 1 Mbps

Range - 150 feet in typical use (varies with building construction)

Frequency band - 2.4 gigahertz (GHz)

Radio output power - 15 dBm (nominal)

Compatibility - 802.11 Direct Sequence Spread Spectrum (DSSS) 1, 2 Mbps standard

- 802.11 HR DSSS 11 Mbps draft standard

TITLE

Power Mac G4: Read Me

Article ID: 58433
Created: 8/31/99
Modified: 1/19/00

TOPIC

This article comprises the Read Me document for the Power Mac G4.

DISCUSSION

Important Information About Your Power Mac G4

This document contains important late-breaking information about your Power Mac G4 computer. You may want to print this document and keep it with your other printed documentation. For additional information, see Mac Help and the print and online documentation that came with your computer. Apple also provides substantial information online. If you have access to the World Wide Web, you can check the latest information about the Power Mac G4 in the support area at the URL **<http://www.apple.com/support>**.

The following topics are covered in this document:

Using your Power Mac G4

Putting your computer to sleep

Copying and pasting alert sounds

Adjusting and testing external speakers

Playing and recording from audio CDs

Using striped volumes

Using a startup disk formatted with third-party formatting software

Performance problems using Ethernet

Connecting your computer directly to an Ethernet switch

Third-party software issues

Connecting RAID volumes formatted with SoftRaid software

Moving Bookmarks and Favorites files before reinstalling Internet Explorer and Netscape Communicator

Hardware compatibility issues

Connecting a monitor that uses a DB-15 connector

Important information about displays

Installing additional ATA hard drives

Formatting external USB (Universal Serial Bus) hard disk drives

Connecting and disconnecting USB devices while the computer is asleep

Using password protection for Zip disks

Using a digital video camera

Using third-party SCSI PCI cards

Using your Power Mac G4

Putting your computer to sleep

Your Power Mac G4 supports new intelligent power management during computer sleep. When your computer sleeps, it will attempt to reduce power usage to the lowest level possible. The lowest power level is achieved by powering off many of the components in the computer, including the PCI bus. Older PCI cards do not support this style of power management, so the PCI bus and the system cooling fan are left powered on during sleep. When you install newer PCI cards which support this new style of power management, or if there are no PCI cards installed, the system cooling fan is turned off during sleep.

Note: If your computer is in sleep with the system cooling fan off, opening the enclosure will cause the computer to wake as a reminder that the computer is not shutdown.

Copying and pasting alert sounds

Long alert sounds require large amounts of memory. If you have difficulty copying and pasting long alert sounds into the Sound control panel, you may need to adjust memory requirements for the control panel. To do this, open the Control Panels folder within the System Folder. Select the Sound control panel, then choose Get Info from the File menu. Increase the preferred memory size until you are able to copy and paste the alert sound. The amount of memory needed depends on the sound quality of the sound input device you are using.

Adjusting and testing external speakers

Use the Output section of the Sound control panel to adjust the overall volume of your computer. The Speaker Setup section of the Sound control panel allows you to adjust the relative volume of speakers connected to your computer. In this section, you can also select which speakers you want to use and change the relative volume for each speaker by using the slider underneath the speaker.

You can also test the speakers connected to your computer by clicking Start Test in the Speaker Setup section. The computer plays a white noise test tone on each speaker, allowing you to adjust the relative volume of that speaker. The white noise test tone contains sound for all frequencies and sounds like static. You may want to reduce the overall sound volume for your computer using the Output section of the Sound control panel before testing your speakers, as the test tone can be quite loud on some speakers.

Playing and recording from audio CDs

Audio CD playback is now done digitally for increased fidelity and use with digital audio peripheral devices. When you play audio CDs, you no longer have to select Internal CD in the Input section of the Sound control panel or the Sound section of the Control Strip. To record from an audio CD, you may need to select Internal CD in the Input section of the Sound control panel or the Sound section of the Control Strip.

Using striped volumes

You cannot start up your Power Mac G4 from a striped volume. Only standard and mirrored volumes can be used as startup volumes.

Using a startup disk formatted with third-party formatting software

You can use third-party software, such as Anubis or FWB, to format and partition a hard disk in your computer. However, if you install a System Folder on one of these partitions and select it as your startup disk in the Startup Disk control panel, the computer will not use the Startup Disk volume selected.

Performance problems using Ethernet

Your computer performs best when the Ethernet port is set to auto-negotiate. If you experience performance problems on your Ethernet network, check with your network administrator.

IMPORTANT: The duplex mode of an Ethernet link to a switch is not detected if the port is not auto-negotiating. In this case, your computer will detect the appropriate speed but will default to half-duplex. If the port at the other end of the link is configured for full-duplex, a large number of late events can occur on the link. Set the switch's port to auto-negotiate where possible. If this is not possible, then set the switch's port to half-duplex. For more information, see the documentation that came with the Ethernet switch.

Connecting your computer directly to an Ethernet switch

If you connect your Power Mac G4 computer directly to an Ethernet switch, disable spanning tree on that port. Otherwise your computer could duplicate the AppleTalk address of another computer on the same network and both network connections would become unreliable.

Third-Party Software Issues

Connecting RAID volumes formatted with SoftRaid software

Hard drives formatted as RAID volumes using SoftRaid software earlier than v2.2, will be incorrectly reported as uninitialized or damaged by the system software on your Power Mac G4. Do not erase or initialize your RAID volumes if this occurs. Your RAID volumes will be correctly recognized by the system software when you update the drivers on your RAID volumes to SoftRaid v2.2 or later.

Moving Bookmarks and Favorites files before reinstalling Internet Explorer and Netscape Communicator

If you inadvertently delete the Internet Explorer or Netscape Communicator applications, you can reinstall the applications using the

software install CD that came with your computer. Before you reinstall Internet Explorer or Netscape Communicator, you must move the file that contains your Internet sites list to a different location, such as the desktop. In Internet Explorer, this file is Favorites.html; in Netscape Communicator, the file is Bookmarks.html. When you reinstall Internet Explorer or Netscape Communicator, the program overwrites these files and any locations or bookmarks that you added or that were preinstalled will be lost.

Hardware Compatibility Issues

Connecting a monitor that uses a DB-15 connector

If you want to use an older monitor that has a DB-15 connector, you need to use a Mac-to-VGA adapter to connect the monitor to the VGA monitor port on the computer. For instructions on doing this, see the documentation that came with your computer.

Some Mac-to-VGA adapters do not allow the monitor to correctly identify itself to the computer. Therefore, incorrect screen resolutions and timings may be shown as Recommended settings in the Monitors control panel and the Monitor Resolution settings in the Control Strip.

To view the correct screen resolutions and timings, do the following:

1. Open the Apple menu, select Control Panels, then choose Monitors.
2. In the Resolution section on the right, click the Show pop-up menu and choose All.

Important information about displays

When connecting an Apple Studio Display monitor with a USB cable to your Power Mac G4, be sure to connect the monitor's USB cable to the USB port on the back panel of the computer. The AppleVision software requires this connection.

If you have an older AppleVision or Apple Studio Display monitor that has an ADB-type cable along with the monitor cable, you will be unable to attach the ADB cable to your Power Mac G4. Connecting the ADB cable to older Macintosh computers would allow automatic software adjustment of the screen image. In order to adjust the screen image on your model of Power Mac, you need to use the external controls on the monitor. For more information see the documentation that came with the monitor.

Installing additional ATA hard drives

If you install an Ultra ATA hard drive in your computer, you must use an 80-pin Ultra ATA cable to connect the ATA drive to your computer. Use only 80-pin Ultra ATA cables; do not use 40-pin ATA cables used with earlier models of Power Macintosh computers. For more information about installing internal storage devices in your computer, see the documentation that came with your computer.

[Editor's Note: The original paragraph above is incorrect. It should state, "If you install an Ultra ATA hard drive in your computer, you must use a 40-pin Ultra ATA cable to connect the drive to your computer. Use only 40-pin Ultra ATA cables; do not use the 40-pin ATA cables used with earlier models of Power Macintosh computers. For more information..."]

Formatting external USB (Universal Serial Bus) hard disk drives

Many USB hard disk drives are DOS-formatted at the factory. You can use DOS-formatted USB hard drives with your computer, but you will get much better performance if the USB hard drive is formatted as Mac OS Extended or Mac OS Standard. To reformat the hard drive to Mac OS Extended or Mac OS Standard format, use the formatting utility that came with the USB hard drive. If you do not have a formatting utility, you can change the drive to Mac OS format by following the steps below.

WARNING: Erasing the hard drive will destroy any data stored on the drive.

1. If you haven't already done so, connect the external USB hard drive to your computer and turn it on.
For more information, see the topic Connecting USB devices to your computer in Mac Help and the documentation that came with the device.
2. Open the Apple menu, select Control Panels, then choose File Exchange.
The File Exchange control panel opens.
3. If necessary, click the PC Exchange tab.
4. Click the checkbox next to Mount at startup. (The checkbox should be blank.)
This turns off PC Exchange.
5. Click the close box to close the control panel.
6. Click the USB drive's icon on the Desktop, then from the Special menu choose Erase Disk.
A window appears.
7. From the Format pop-up menu, select Mac OS Extended or Mac OS Standard format, then click Erase.

Connecting USB devices while the computer is asleep

When you connect a USB device from your computer while the computer is in sleep mode, your computer automatically wakes.

Using password protection for Zip disks

The installed USB Mass Storage Support driver does not support Zip drive password protection. When a password-protected disk is inserted, the disk is ejected and a dialog box appears saying that this feature is not supported. Contact the Zip drive manufacturer to obtain software that supports this feature.

Using a digital video camera

Some DV cameras have a problem establishing a DV link. If your computer does not recognize your DV camera, try turning the camera off and on to establish the DV Link.

Using third-party SCSI PCI cards

Many older third-party SCSI PCI cards installed in your computer may not work or you may experience problems with SCSI devices that are connected to this card's port your computer. Some wide SCSI cards will only support 8 devices and not 15, which is the SCSI specification. Contact the card's manufacturer or see the manufacturer's Web site for the latest information on compatibility and possible firmware updates.

TITLE

Power Mac G4: Technical Specifications

Article ID: 58434
Created: 8/31/99
Modified: 1/24/00

TOPIC

This article comprises the technical specifications for the Power Mac G4. A description of the computer can be found in TIL article 58435: "[Power Mac G4: Description](#)".

Technical specifications for the Macintosh Server G4 can be found in article 58577: "[Macintosh Server G4: Technical Specifications](#)".

DISCUSSION

Technical Specifications

All configurations include the following features (unless noted).

Processor

- 350-, 400-, or 450-MHz PowerPC G4 processor
- Velocity Engine vector processing unit with 162 integrated Single Instruction Multiple Data (SIMD) instructions
- full 128-bit internal memory data paths
- powerful new floating-point unit supporting single-cycle, double-precision calculations
- data stream prefetching operations supporting four simultaneous 32-bit data streams
- 1MB backside level 2 cache running at half the processor speed
- 100-MHz system bus supporting up to 800-MBps data throughput

Memory

- 64MB, 128MB, or 256MB of PC100 SDRAM (3.3-volt, unbuffered, 64-bit-wide, 168-pin, running at 100 MHz)
- four DIMM slots support up to 1.5GB of PC100 SDRAM (999MB maximum per application) using the following DIMMs:
 - 32MB, 64MB, or 128MB DIMMs (64-bit-wide, 64-Mbit technology)
 - 128MB or 256MB DIMMs (64-bit-wide, 128-Mbit technology)
 - 512MB DIMMs (64-bit-wide, 256-Mbit technology)

Storage

- one of the following hard disk drives:
 - 10GB 5400-rpm Ultra ATA/33 hard disk
 - 20GB 7200-rpm Ultra ATA/66 hard disk
 - 27GB 7200-rpm Ultra ATA/66 hard disk
- one of the following optical drives:
 - 32x-speed (maximum) CD-ROM drive
 - DVD-ROM drive with DVD-Video playback
 - DVD-RAM drive with DVD-Video playback
- 100MB Zip drive (some configurations)
- three 3.5-inch hard disk drive expansion bays:
 - One ATA drive preinstalled in standard configurations
 - Support for up to two internal ATA drives
 - Support for up to three internal SCSI drives

Graphics support

- ATI RAGE 128, or ATI Rage 128 Pro graphics card with 16MB of SDRAM graphics memory installed in a dedicated graphics slot (either a 66-MHz PCI slot or a 133-MHz AGP 2X slot)
- support for up to 1,600 x 1,200-pixel resolution at 32 bits per pixel (millions of colors) and up to 85-Hz refresh rate
- 15-pin mini D-Sub VGA connector; Rage 128 Pro card adds a DVI connector for digital displays
- The maximum supported resolution is 1920 x 1080; 1920 x 1200 with Rage 128 Pro graphics card.

Keyboard and mouse

- Apple USB Keyboard with 2-meter cable and Apple USB Mouse

Electrical requirements and agency approvals

- line voltage: 115V AC (90V to 132V AC) or 230V AC (180V to 264V AC)
- frequency: 47 to 63 Hz, single phase
- maximum continuous power (not including display): 200W
- EPA ENERGY STAR and Blue Angel compliant (some configurations)

Environmental requirements

- operating temperature: 50to 95F (10to 35C)
- storage temperature: -40to 116F (-40to 47C)
- relative humidity: 5% to 95% noncondensing
- maximum altitude: 10,000 feet (3,048 m)

Size and weight

- height: 17.0 inches (43.2 cm)
- width: 8.9 inches (22.6 cm)
- depth: 18.4 inches (46.7 cm)
- weight: 30.0 pounds (13.6 kg)

TITLE

Power Mac G4: Description

Article ID: 58435
Created: 8/31/99
Modified: 1/5/00

TOPIC

This article describes the Power Mac G4. The technical specifications can be found in TIL article 58434: "[Power Mac G4: Technical Specs](#)".

DISCUSSION

Apple designed the new Power Mac G4 for creative professionals who use computers as the pivotal tool of their trade, setting the pace of their work, their productivity, even their success. With its Pentium-crushing speed and convention-crushing design, the Power Mac G4 picks up where the best-selling Power Macintosh G3 left off. It's simply the fastest desktop computer ever, easily running up to a stunning 100% to 200% faster than the fastest Pentium III-based PCs. The Power Mac G4 is so powerful that its speed is measured in gigaflops, or billions of floating-point operations per second, just like supercomputers.

At the heart of this system is the brand-new PowerPC G4 with Velocity Engine. Using vector processing, the PowerPC G4 brings supercomputer performance to the desktop for the first time. The Velocity Engine moves vector and multimedia data at superefficient speeds--it can process data in 128-bit chunks, instead of the smaller 32-bit or 64-bit chunks used in traditional processors. System performance is further enhanced through the use of an all-new, superfast system bus and 1 megabyte of backside cache.

Expansion is this computer's particular talent. It accommodates more than 100 gigabytes of hard disk storage and up to 1.5 gigabytes of SDRAM. 2 USB and FireWire ports let you connect to high-bandwidth peripherals such as printers, digital video cameras, hard disk drives, and more. Three 64-bit PCI slots, a feature that until recently was available only in high-end workstations, support a wide variety of expansion cards. Choose Apple's Final Cut Pro video editing software for flexible, highly productive video editing, compositing, and special effects.

When you're ready, get unwired with AirPort, Apple's new high-speed wireless local area network option. AirPort gives you the freedom to surf the Internet without cables, additional phone lines, or complicated networking hardware. Just install the AirPort wireless networking card, connect to an AirPort wireless network, and start surfing from your business, classroom, or any room in your home.

For all those who consider their desktop system a tool for expressing their creative abilities, there's finally a computer that can keep up with everything their minds can imagine--as quickly as they can imagine it. Power Mac G4.

Superior performance

- PowerPC G4 processor running at up to 450 megahertz and featuring Velocity Engine advanced vector processing technology
- 1 megabyte of backside level 2 cache running at half the processor speed
- built-in 10/100BASE-T Ethernet networking
- ATI RAGE 128 graphics card with 16MB of graphics memory

Maximum expansion

- support for up to 1.5 gigabytes of high-performance PC100 SDRAM
- four expansion slots, including three 64-bit PCI slots and one dedicated graphics card slot (either a 66- megahertz PCI slot or an AGP 2X slot)
- support for more than 100 gigabytes of internal hard disk storage
- two or three 400-megabit-per-second FireWire ports for connecting up to 63 devices, including digital video cameras, hard disk drives, and high-speed multimedia peripherals
- two Universal Serial Bus (USB) ports for connecting up to 127 peripherals

Elegant design

- instant access side door makes it very easy to install cards, drives, and memory
- built-in antenna and support for optional AirPort wireless networking (some configurations)

..TIL58435-Power_Mac_G4_Description.pdf

- convenient low-power sleep/wake feature that virtually eliminates the need to shut down the computer (some configurations)

Performance Comparison

For up-to-date benchmark information, visit <http://www.apple.com/powermac> on the World Wide Web.

TITLE

Power Macintosh G3/G4: Black Screen After Installing
ATA Zip Drive

Article ID: 58440
Created: 9/1/99
Modified: 1/5/00

TOPIC

After installing an internal Iomega Zip drive on a Power Macintosh G3 (Blue and White), the computer boots to a black screen.

DISCUSSION

On Power Macintosh G3 (Blue and White) and Power Mac G4 computers, it is important to make sure that the power cable is connected to the internal Zip drive before powering up the computer. If only the data cable is connected, the computer will start up to a black screen.

If this should occur, power down the computer and make sure both the data and power cables are properly connected to the internal Zip drive then reboot the computer. If the problem persists, consult your Apple-authorized service provider for further troubleshooting.

TITLE

Power On Self Test Beep Definition - Part 2

Article ID: 58442
Created: 9/7/99
Modified: 10/4/99

TOPIC

The Power Mac G4 (AGP Graphics), iBook, and iMac (Slot Loading) use a revised set of power on self test beeps during startup. This article describes each one.

Refer to TIL article 58183: "[Power On Self Test Beep Definition - Part 1](#)" for information on earlier computers.

DISCUSSION

The power on self test resides in the ROM of the computer. This test runs whenever the computer is powered on after being fully shut down (the power-on self test does not run if the computer is only restarted).

If a fault is detected during the test, you will not hear a normal startup chime. Instead, the system will beep as explained below. If you experience one of these beeps, you should call your Apple Authorized Service Provider for additional troubleshooting assistance.

- 1 beep = no RAM installed
- 2 beeps = incompatible RAM types
- 3 beeps = no good banks
- 4 beeps = no good boot images in the boot ROM (and/or bad sys config block)
- 5 beeps = processor is not usable

TITLE

iMac (Slot Loading): How to Eject a CD

Article ID: 58465
Created: 10/4/99
Modified: 1/13/00

TOPIC

Since the iMac (Slot Loading) has a slot loading CD-ROM drive similar to an automobile CD player, how do I eject a disc in an emergency or at startup? I don't see a mechanical eject button like on previous CD-ROM drives.

DISCUSSION

The CD eject mechanism is electrical rather than mechanical on the iMac. If you wish to eject a startup CD-ROM disc at startup, simply press the mouse button until it ejects. If the CD is not a startup disc, simply wait for the iMac to startup and drag the CD icon to the trash can.

If this fails to release the CD, there is an eject button that can be activated by a small, blunt object such as a paper clip. The button is located on the right side of the CD slot. The power must be on to eject a CD using this method.

Once you eject the CD, it will extend just past the center hole in the disc to facilitate its safe removal from the drive.

Important: After ejecting the CD with the manual eject button, you must restart your iMac to restore functionality to the CD-ROM drive.

Note: Because the CD-ROM drive is slot loading, only round, standard size (4.7 inch or 120 mm) CDs are to be used. The mechanism does not support 3 inch or irregularly shaped CDs; damage may occur if they are used.

TITLE

iMac (Slot Loading): Upgrading Memory

Article ID: 58466
Created: 10/4/99
Modified: 1/13/00

TOPIC

What is the memory expansion capability and specification for the iMac (Slot Loading)?

DISCUSSION

The iMac (Slot Loading) uses standard PC-100 DIMMs with the following specifications:

- PC-100 Synchronous DRAM (SDRAM)
- 64-bit wide, 168-pin module
- maximum of 16 memory devices on the DIMM
- unbuffered; do not use registered or buffered Synchronous DRAM (SDRAM)
- maximum height of 2.0 inches.

There are two DIMM slots accessible from the bottom of the computer. Use a coin, such as a quarter, to release the access panel and install the DIMM or DIMMs.

The maximum DIMM size for each slot is 256 MB, for a total of 512MB. Depending upon which iMac model you purchase, the base amount of memory will vary. The base model has 64 MB, the iMac DV has 64 MB, and the iMac DV Special Edition has 128 MB.

There is 8 MB of soldered SDRAM dedicated for video. Although it's not upgradeable, iMac can display 24-bit color at its highest resolution. In addition, the computer now uses AGP2X to make use of main memory for 3D rendering.

TITLE

iMac (Slot Loading): How to Connect External Display to
VGA Port

Article ID: 58467
Created: 10/4/99
Modified: 1/13/00

TOPIC

According to the specs for my iMac, it has a VGA port for video mirroring, yet I cannot seem to locate the port to connect the display. Where is it?

DISCUSSION

Only iMac DV models support VGA video mirroring. This feature allows you to display the same image on two different monitors, such as in a classroom environment. You cannot use the second monitor to extend your desktop area.

To access the VGA port, you'll need to replace the vented cover with the VGA vented cover provided in the accessory kit with the iMac DV models. Instructions are provided online in Mac Help on each computer.

If your iMac did not originally ship from Apple with VGA video mirroring capability already installed, there is no upgrade from Apple to provide this functionality.

Note: The image size displayed on the external monitor will match that shown on the built-in iMac monitor. If no image is displayed on the external monitor, try switching the resolution in the Monitors control panel to 1024 x 768 at 75 Hz, then back to the desired resolution.

TITLE

iMac (Slot Loading): Sound Out Volume Lower with 3D
Sound Selected

Article ID: 58468
Created: 10/4/99
Modified: 1/13/00

TOPIC

Is it normal for the speaker volume to be lower when 3D Sound is selected in the Sound control panel?

DISCUSSION

Yes, due to the method in which 3D sound is created, the sound level will be slightly lower than if 3D sound was not selected. Selecting 3D sound simulates a wider sound-field that results in a slightly lower volume level.

TITLE

iMac (Slot Loading): Different Functionality for Power Button

Article ID: 58470
Created: 10/4/99
Modified: 1/13/00

TOPIC

The iMac (Slot Loading) power button has different functionality compared with previous iMac and other Macintosh computers.

DISCUSSION

The following table explains the result of pressing the iMac power button. The keyboard power button retains the same functionality as earlier iMac computers whereby you are presented with a dialog box to cancel, sleep, restart, or shut down your iMac.

	Current State	Result of Pressing
iMac button	Powered on	Immediate sleep unless server mounted, then dialog box presented
	Powered on but not responsive	Press and hold for 5 seconds to shut down iMac.
	Powered off or in sleep	Powers on or wakes from sleep

TITLE

iMac (Slot Loading): What's New and Different

Article ID: 58471
Created: 10/4/99
Modified: 1/13/00

TOPIC

This article lists the major new features of iMac (Slot Loading), as well as a brief description.

DISCUSSION

Here are the major new features of iMac:

- Slot loading CD- or DVD-ROM drive - Rather than using a tray to hold the CD, the iMac (Slot Loading) has a slot similar to an automotive CD player. Simply insert any 4.7 inch (120 millimeter) CD into the slot and iMac takes it from there.
- The iMac DV models have a slot loading DVD-ROM drive in place of the CD-ROM drive.
- VGA Mirroring - There is a VGA port on the iMac DV models that provides the capability to connect an external VGA style monitor to mirror the image on the iMac screen.
- FireWire - There are two 400 Mbps FireWire ports on the iMac DV models for use with high-speed FireWire devices such as video camcorders and hard drives. More information on FireWire and FireWire devices can be found at <http://www.apple.com/firewire/>.
- Firewire cable - To enable early adopters to get started making movies quickly, Apple is including as a special bonus, an Apple-designed FireWire camcorder (4-6 pin) cable in the box with iMac DV models. This is being provided for the first month, or while supplies last.
- Wireless networking ready - The iMac is ready to accept the an AirPort card. An antenna is built-in to the iMac enclosure.
- Better sound - The front speakers of iMac provide improved mid and high range sound, while a speaker port on the underside of iMac improves low end bass response.
- Dual Channel USB - Each USB port now has its own dedicated USB controller providing enhanced functionality such as USB booting and USB audio support.
- No System Fan - The iMac (Slot Loading) does not have an internal system fan. Instead, it relies on convection for cooling.

iMac (Slot Loading): Differences Between Models

Article ID: 58473
Created: 10/4/99
Modified: 1/24/00

TOPIC

This article documents the differences between models of the iMac (Slot Loading) computer.

DISCUSSION This table documents the major feature differences between the three iMac models introduced in September, 1999.

Feature	iMac	iMac DV	iMac DV Special Edition
Color	Blueberry	Tangerine, Blueberry, Strawberry, Grape, Lime	Graphite
Hard Drive	6 GB	10 GB	13 GB
Memory	64 MB	64 MB	128 MB
Processor	350-MHz G3 processor	400-MHz G3 processor	400-MHz G3 processor
CD or DVD Drive	CD-ROM	DVD-ROM	DVD-ROM

TITLE

iMac (Slot Loading): Technical Specifications

Article ID: 58474
Created: 10/4/99
Modified: 1/24/00

TOPIC

This article provides the technical specifications for the iMac (Slot Loading) computer.

DISCUSSION

Technical Specifications

Processor and Memory

- 350- or 400-MHz PowerPC G3 processor
- 512K backside level 2 cache
- 100MHz system bus
- 64 MB or 128 MB of PC100 SDRAM (3.3-volt, 64-bit wide, 168-pin, running at 100 MHz); two DIMM slots support up to 512 MB using 64 MB, 128 MB, or 256 MB DIMMs

Display

- built-in 15-inch shadow-mask CRT (13.8-inch diagonal viewable image size); 0.28-mm dot pitch
- built-in ColorSync color calibration for uniform color from input to display to output
- on-screen geometry adjustment to keep display images properly aligned throughout its lifetime
- flip foot for 17° tilt

Graphics Support

- ATI RAGE 128 VR 2D/3D graphics accelerator with 8 MB of SDRAM graphics memory and AGP 2X support
- Three crisp, flicker-free screen resolutions: 640 x 480 pixels at 117 Hz, 800 x 600 pixels at 95 Hz, and 1,024 x 768 pixels at 75 Hz
- 24-bit true color at all resolutions for displaying millions of colors

Storage

- 6 GB, 10 GB, or 13 GB Ultra ATA hard disk drive
- Slot-loading, 24x-speed (maximum) CD-ROM drive; or slot-loading, 4x-speed (maximum) DVD-ROM drive (plays DVD-Video discs; plays CD-ROMs at up to 24x speed)
- Support for external USB storage devices; DV models also support external FireWire storage devices

Communications

- built-in 56K modem supports V.90 and K56flex standards (RJ-11 connector)*
- built-in auto-switching 10/100BASE-T Ethernet (RJ-45 connector)
- AirPort wireless networking slot for optional AirPort Card; runs at up to 11 Mbps; 150-foot maximum range (depending on surrounding environment); 2.4 GHz frequency; nominal power output of 15 dBm; compatible with other devices that comply with the IEEE 802.11 and 802.11HR specifications

Peripheral connections

- two USB ports running at up to 12 Mbps each; provides up to 500 milliamps per port to support bus-powered devices
- two, 6-pin FireWire (IEEE 1394) ports running at up to 400 Mbps (DV models only); provides 6 watts of power to support bus-powered devices

Audio

- integrated, high-performance Odyssey audio system from Harman Kardon
- built-in microphone for speech recognition and audio recording
- front-mounted dual mini headphone jacks

..TIL58474-iMac_(Slot>Loading)_Technical_Specifications.pdf

- analog audio input and output minijacks; up to 16-bit stereo and 44.1kHz sampling rate
- support for external USB audio devices

Video (DV models only)

- standard VGA output port (15-pin mini D-Sub connector)
 - supports video mirroring: external devices display an image identical to that shown on the built-in display

Keyboard and Mouse

- Apple USB Keyboard
 - integrated two-port USB hub with two Type A USB connectors
 - two-position adjustable slope (0° and 6°) using flip foot
 - 12 programmable function keys
- high-resolution (400 dpi) Apple USB Mouse

Electrical Requirements and Agency Approvals

- line voltage: 100V to 260V
- AC Frequency: 47 to 63 Hz, single phase
- maximum continuous power: 150 W
- EPA ENERGY STAR compliant

Environmental Requirements

- operating temperature: 50° to 95° F (10° to 35° C)
- storage temperature: -40° to 116° F (-40° to 47° C)
- relative humidity: 5% to 95% noncondensing
- maximum altitude: 10,000 feet (3,048 m)

Size and weight

- height: 15.0 inches (38.1 cm)
- width: 15.0 inches (38.1 cm)
- depth: 17.1 inches (43.5 cm)
- weight: 34.7 pounds (15.8 kg)

*Actual modem speeds lower; speed depends on connection rate and other factors.

TITLE

iMac (Slot Loading): Buzzing Noise After Shutdown

Article ID: 58527
Created: 11/22/99
Modified: 1/24/00

TOPIC

This article describes a buzzing noise heard from the iMac (Slot Loading) after shut down.

DISCUSSION

A very small number of iMac (Slot Loading) computers may produce a buzzing or humming noise from the speakers after shut down. The noise can last for several minutes and will go away if the power cord is unplugged from the computer.

If your iMac (Slot Loading) makes a loud buzzing or humming noise after shut down, contact Apple or an Apple-authorized service provider for assistance in getting the issue resolved.

EXTENDED Information - [Apple Internal Use](#) - [Service Providers and Support Professional](#)

The root cause of the buzzing noise is on the main logic board. The problem is most likely to occur when the iMac (Slot Loading) is plugged into a 220 volt or higher power source, however, it can occur when the iMac is plugged into a 110 volt power source.

If a customer complains that their iMac (Slot Loading) makes a loud buzzing or humming noise after shut down, replace the main logic board under warranty. Refer to Service Source for instructions on replacing the main logic board.

TITLE

iMac (Slot Loading): Installing AirPort Card

Article ID: 58537
Created: 12/1/99
Modified: 1/24/00

TOPIC

This article provides instructions for installing the AirPort Card into an iMac (Slot Loading) computer. Similar instructions, with graphics, are included with the AirPort Card.

DISCUSSION

1. Before installing, shut down the computer, unplug all cables, except the power cord, and place the computer face down on a soft cloth.
 2. Unlock the access door using a coin, then open the door.
 3. Touch the metal shield inside the recessed latch area to discharge static electricity, then unplug the power cord from the computer. Don't walk around the room until you've finished installing the AirPort Card.
 4. Detach the antenna from the left rail guide on the upper AirPort Card slot and remove the protective cap. Then connect the antenna to the AirPort Card.
 5. Align the edges of the AirPort Card with the guides on the slot and insert the AirPort Card sideways into the slot.
 6. Close the access door and use a coin to lock it. Reconnect all cables and cords, then press the Power button on the computer. Never turn your computer on unless all of its internal and extra parts are in place.
- Instructions for using the AirPort software are in Mac Help, available in the Help menu.

EXTENDED Information - Apple Internal Use - Service Providers and Support Professional

TITLE

Mac OS X Server: About Mac OS X Server

Article ID: 60101
Created: 3/11/99
Modified: 1/11/00

TOPIC

Contents

Introduction
Backing Up and Restoring Your Mac OS X Server
AppleShare and Apple File Services Issues
QuickTime Streaming Server Preview Software
Obtaining Database Adapters for WebObjects
Selecting Ethernet Ports
Naming Users and Groups
Other Issues

Note: This document was installed by Mac OS X Server in /System/Documentation/ReadMe. For a list of other release notes see: Tech Info Library Article 30925: "[Mac OS X Server: Release Notes](#)"

DISCUSSION

Introduction

This document provides information about your Mac OS X Server software that supplements the information in the Mac OS X Server Installation Manual. Read this document for information about known problems with this release and possible solutions. Additional information can be found in the following places:

- Read Me documents available in the System/Documentation/ReadMe/ folder
- Read Me documents in the Admin folder in the NetBoot installation volume
- the Help menu

For up-to-date news and compatibility information, see the Apple Support Web site at <http://www.apple.com/support>.

Note: If you are familiar with UNIX-based systems, you will find using your Mac OS X Server easier. Information in this document and the other Read Me documents included with your server assume you are familiar with this type of operating system.

Backing Up and Restoring Your Mac OS X Server

Your Mac OS X Server system uses a UFS format volume. You may also have Mac OS (Standard or Extended) format volumes on your Mac OS X Server. At present, to back up and restore volumes, you need to follow different procedures depending on the format of the volume.

Complete backup and restore solutions should be available soon from third-party developers, such as OmniGroup Backup & Restore. For information about the availability of OmniGroup Backup & Restore, see <http://www.omnigroup.com/Software/Backup/>.

Backing Up and Restoring Mac OS Format Volumes

To back up and restore Mac OS format volumes, you can use third-party programs such as Retrospect from Dantz Development Corporation. To use such a program, install the software in the Mac OS environment (open the Apple menu and choose Mac OS), then open the program and follow the instructions provided with the software.

Important: Retrospect does not back up permissions information for files and folders. If you restore a volume using Restrospect, you will need to set permissions again.

Backing Up and Restoring Mac OS X Server Format Volumes

For information about backing up and restoring a Mac OS X Server format volume, go to the Apple Support Web site at <http://www.apple.com/Support>.

AppleShare and Apple File Services Issues

AppleShare password security: When a client user logs in to Apple file services, the user's password is sent over the network in clear text form. Someone monitoring your network traffic could get the Administrator password, thus compromising your network's security. For information about updates to correct this situation, see <http://www.apple.com/Support>.

AppleShare client software: To connect to an Apple file services volume from a client computer, you need to install the AppleShare client software, versions 3.8.2, on the client computer. This version is available in the Utilities folder on your Mac OS X Server installation CD.

Connecting to Apple file services using IP: If you want to connect to Apple file services from a client computer using IP, instead of AppleTalk, you need to enter the server's IP address in the Router box in the TCP/IP control panel on each client computer. To do so, open the TCP/IP control panel on the client computer, choose Ethernet from the "Connect via" popup menu and Manually from the Configure popup menu, then enter the server's IP address in the Router address box, as well as the other information required for the connection.

QuickTime Streaming Server Preview Software

This release of Mac OS X Server includes a preview release of the QuickTime Streaming server, which will let you deliver rich digital media over the Internet or intranets to any QuickTime-capable application. For information about updates for QuickTime Streaming, see the QuickTime Web site at www.apple.com/quicktime/.

Note: Telephone support is not available for preview software, such as QuickTime Streaming server.

Obtaining Database Adapters for WebObjects

Your Mac OS X Server includes WebObjects adaptors that let WebObjects applications connect to and retrieve data from OpenBase and flat-file databases. An adaptor for Oracle will be available soon. For information about availability of other adaptors, see the Apple Developer Web site at <http://www.apple.com/developer>.

Selecting Ethernet Ports

If you purchased a Mac OS Server G3 With Mac OS X Server, it includes a four-port Ethernet card. An illustration in "Connecting to an Ethernet Network," in Chapter 1 of Setting Up Your Macintosh Server G3, shows the four ports of the Ethernet card numbered 1 to 4 from left to right. However, the ports are numbered from right to left. Therefore, in the Setup Assistant or Network settings panel, Ethernet Card Port 1 corresponds to the port on the right while Ethernet Card Port 4 corresponds to the port on the left.

Creating and Changing Users and Groups

You should name users and groups on a Mac OS X Server using only the lowercase alphabetic characters (a-z), the numeric characters (0-9), and the underscore character. This includes users and groups you create for Apple file services using Remote Server Administration.

If you create a NetInfo user account on your Mac OS X Server, do not use a name that you plan to use for a Macintosh Manager user account. If you do, you will see a warning message when you try to create a user with that name in Macintosh Manager.

Remote Administration shows Administrator (root), Unprivileged user (nobody), and macos group. Do not change the names of these items.

NetworkManager lets you change the names and IDs of all user accounts and groups. Do not change the names or IDs of user accounts and groups with IDs less than 100.

Other Issues

- You cannot start up a Mac OS X Server from an ATA disk configured in Slave mode.
- You should not change the name of a volume used by NetBoot server unless absolutely necessary. If you do change the name of the volume, you will need to install the NetBoot server software again.
- You can customize the contents of your Mac OS X Server Apple menu by choosing Configure Menu from the Apple Menu. If Configure Menu is not available, open the AppleMenuOptions application directly from the Workspace Manager. The application is located in the System/Applications folder.
- The floppy disk driver supports MFM formats such as 1.44 MB and 720 MB floppies. At present, it does not support formatting and writing to GCR formats such as 400K and 800K. Therefore, GCR floppies are marked as Write Protected.

Mac OS X Server: General FAQ

Article ID: 60165
Created: 3/18/99
Modified: 1/11/00

TOPIC

This article contains frequently asked questions (FAQ) about Mac OS X Server. See also Tech Info Library articles:

Article 60166: "[Mac OS X Server: Operating System FAQ](#)"

Article 60167: "[Mac OS X Server: Services FAQ](#)"

Article 60168: "[Mac OS X Server: NetBoot/Macintosh Manager FAQ](#)"

Article 60169: "[Mac OS X Server: Hardware and Compatibility FAQ](#)"

Article 60170: "[Mac OS X Server: Pricing and Availability FAQ](#)"

DISCUSSION

Q. What is Mac OS X Server?

A. Mac OS X Server is the first in a line of new server software products that demonstrate Apple's commitment to providing servers that meet the needs of its customers. The first release of Mac OS X Server will be available in both software and hardware configurations. It is the first product built on the core technology of Mac OS X, the desktop operating system scheduled for later in 1999. It includes innovative services such as the Apache Web server, WebObjects application server, NetBoot workgroup management technology, and Apple file services.

Q. When will Mac OS X Server be available?

A. Mac OS X Server is now available in English in the U.S. and Canada. It is scheduled to be available worldwide in April in English, Japanese, French, and German.

Q. Who is the target customer for Mac OS X Server?

A. Mac OS X Server is designed for use by experienced system and network administrators, who typically have had previous experience with configuring and managing at least two of the following:

- AppleShare IP and At Ease for Workgroups
- complicated networks, including routing between subnets
- other UNIX servers, such as Solaris and Linux

Q. Is Mac OS X Server the same as Mac OS X?

A. No. The client (end-user) version of the Mac OS X operating system is scheduled to be available at the end of the year. While Mac OS X will include an upgraded version of the Mac OS X Server foundation, the user experience will be optimized for a desktop operating system and will be more familiar to today's Mac OS users. Unlike Mac OS X, Mac OS X Server does not include Carbon, the technology for porting today's Macintosh applications to the new foundation.

Q. How does Mac OS X Server differ from AppleShare IP?

A. The two servers offer different types of services. AppleShare IP is a general-purpose server that includes a fully integrated set of services based on the familiar Mac OS 8.5 operating system, delivering high performance and exceptional ease of use. Some key services are unique to AppleShare IP, such as mail servers, SMB support, and firewalls.

Mac OS X Server provides innovative services such as an Apache Web server, WebObjects network application services, and the revolutionary new NetBoot server software for easily managing numerous Mac systems. Mac OS X Server provides these services through

a powerful core operating system, which features advanced capabilities such as preemptive multitasking and protected memory for incredible stability and scalability.

Q. How does Mac OS X Server provide greater scalability than AppleShare IP?

A. Mac OS X Server is scalable in four key ways:

- The core system supports over 1,000 simultaneous user connections.
- The multithreaded file system can handle over 4,000 open files per process.
- Advanced networking provides support for multiple 100-megabit-per-second network interface cards, allowing simultaneous full-bandwidth file transfers across multiple subnets.

Q. Will there be future releases of Mac OS X Server?

A. Yes. Mac OS X Server lays the foundation for Apple's future server software. Over time, it will incorporate features currently available only in AppleShare IP. Mac OS X Server will evolve into a bundle of services built on top of Mac OS X, similar to the way AppleShare IP currently builds services on top of Mac OS 8.

Q. Will there be future releases of AppleShare IP?

A. Yes, but Apple is not announcing specific plans at this time. Over time, Mac OS X Server will incorporate identical or equivalent functionality to AppleShare IP, and will become Apple's sole server operating system product.

Q. Is Mac OS X Server the same as Rhapsody?

A. No. Mac OS X Server leverages a number of the technologies formerly called Rhapsody. In addition, it includes some innovative services that were not part of the original Rhapsody project.

Article 60170: "[Mac OS X Server: Pricing and Availability FAQ](#)"

DISCUSSION

Q. What is the foundation for Mac OS X Server?

A. Mac OS X Server is based on a Mach microkernel that roughly corresponds to Mach 2.5. This microkernel is integrated with an implementation of BSD 4.4 to provide a full UNIX-style operating environment.

Q. Is Mac OS X Server based on UNIX?

A. Mac OS X Server is built on UNIX technologies, implementing most of the POSIX APIs, which makes it easy to port UNIX applications, particularly those from a BSD heritage. The main exception is applications with a graphical user interface, because Mac OS X Server doesn't include the X Window System UI toolkits. Mac OS X Server is built around a graphical interface, unlike traditional UNIX systems that rely on the command line. However, Mac OS X Server cannot be called a UNIX operating system, as it does not fully comply with the POSIX and X/OPEN specifications required for use of the UNIX trademark.

Q. Does Mac OS X Server use a command line interface?

A. The primary interface is a Mac-like user interface, allowing administration with graphical tools. For administrators who prefer the command line interface or make use of Telnet/rlogin for remote administration, a Terminal application and several UNIX shells are included, as well as standard tools such as NFS, FTP, Perl, Tcl, and Emacs.

Q. Does configuring Mac OS X Server require editing configuration files?

A. No. Mac OS X Server provides a friendly Setup Assistant and a rich set of graphical administration tools. Editing configuration files is not required for basic use of any of the core services. However, certain UNIX-derived services such as Apache use their existing configuration files for advanced administration.

Q. Does Mac OS X Server support remote administration?

A. Yes. There are currently several options, each suited to different purposes. Users, groups, and mountable volumes can be managed via a web-based remote-administration tool, similar to the one in AppleShare IP Configuration information can also be managed from another Mac OS X Server system via NetInfo, the built-in Network Directory Service. In addition, UNIX-savvy system administrators can enable Telnet for command line-based remote administration.

DISCUSSION

Q. What are the key services provided with Mac OS X Server?

- A. There are four primary services in this release of Mac OS X Server:
- Apache Web server
 - WebObjects network application services
 - NetBoot and Macintosh Management server software for workgroup administration
 - Apple file services

Q. What is Apache?

A. Apache is today's most popular Web server, serving over half of the public Web sites on the Internet. Apache is an open-source HTTP server developed by the Apache Group (www.apache.org). The Apache source code is freely available, making it easy for a large community to assist in fixing bugs, porting to new platforms, and customizing for special purposes.

Q. What version of Apache is included in Mac OS X Server?

A. Mac OS X Server includes Apache 1.3.4, the latest version available at the time of release. We are working with the Apache Group to ensure that future versions of Apache will compile directly on Mac OS X Server.

Q. How is Apache administered?

A. Basic administration of Apache is very simple. The Setup Assistant and control panels allow for easy on/off configuration, as well as selection of the hostname and documents director y. For advanced configuration, you can edit the same configuration files used by Apache on other platforms.

Q. What is WebObjects?

A. WebObjects is the industry's leading application server, with a flexible, scalable architecture for creating and deploying network applications. WebObjects provides a dynamic object-oriented environment for creating applications that can draw their data from a database server and run their user interface on any standard Web browser. WebObjects makes it easy to develop personalized content, e-commerce solutions, and MIS applications. For more information, see www.apple.com/webobjects.

Q. Which version of WebObjects is included with Mac OS X Server?

A. Mac OS X Server includes WebObjects 4.0.1, along with a 50-transaction-per-minute deployment license. The deployment license can be used for testing or for low-volume usage, or it can be upgraded for full-scale Internet deployment. For the first release of Mac OS X

Server, Apple is including all of the WebObjects developer tools. These tools can be used for compiling WebObjects network applications, database client/server applications, or UNIX server applications. The included license covers only the tools and runtimes for Mac OS X Server. WebObjects 4.0.1 for Windows NT and UNIX platforms will continue to be available as a separate product.

Q. What is NetBoot?

A. NetBoot is a revolutionary Apple technology for managing Macintosh networks. System and user files are stored on the server, bypassing the local hard disk drive, thus making it easy to centrally administer large networks of Macintosh clients. Mac OS X Server also includes Macin-tosh Manager, a tool for allowing users of both NetBoot and non-NetBoot client computers to access their personal files and desktop environment from anywhere on the network.

Q. Which Apple file services are included?

A. Mac OS X Server includes a high-performance native implementation of AFP, the Apple File Protocol, allowing it to share HFS Plus volumes with any AppleShare client over TCP/IP or AppleTalk. You need to update client systems to the latest AppleShare client (version 3.8.2 or later) to ensure reliability, performance, and security. User, group, and mountable volume information can be managed remotely using a Web-based remote-administration tool, similar to the one in AppleShare IP.

Q. Can I transfer my AppleShare IP user and group information to Mac OS X Server?

A. Yes. AppleShare IP includes the ability to export its user information, which can then be imported into Mac OS X Server. It does not export passwords and group information, however, so that information will need to be recreated.

Q. Does Mac OS X Server support Windows clients via SMB file sharing?

A. This version does not provide integrated support for native Windows (SMB) file sharing. However, Mac OS X Server can support Windows clients that function as AppleShare clients. Several third-party solutions should be available, including the free SAMBA server.

Q. Is QuickTime streaming available with Mac OS X Server?

A. A preview version of the QuickTime Streaming Server was included with Mac OS X Server. The final version of this software was released by Apple 19 April 1999 and is available for downloading from Apple Software Updates Online. Please see Software Updates Document Number 11366, or use your Web browser to access the article at: <http://asu.info.apple.com/swupdates.nsf/artnum/n11356>. QuickTime 4 is required to view movies streamed by QuickTime Streaming Server. QuickTime 4 Pro is required to created streaming movies.

Q. Is print spooling available?

A. Yes. Macintosh customers can use the Desktop Printer Utility LPR support to connect to a Mac OS X Server print spooler. Mac OS X Server can spool files to any PostScript-capable network printer over either AppleTalk or TCP/IP. There are also a number of third-party print-spooling products available for the publishing industry.

Q. How many clients can Mac OS X Server support?

- A. The Macintosh Server G3 with Mac OS X Server configuration running a single service, if properly configured, can support:
- Millions of Web transactions a day
 - Approximately 50 NetBoot clients
 - Over a thousand AppleShare clients
 - Thousands of Macintosh Manager clients

The actual number of clients supported depends on your network environment, usage scenarios, and hardware configuration.

Q. Can Mac OS X Server run all these services at the same time?

A. Not quite. Thanks to the power of preemptive multitasking, you can efficiently run multiple services on a single server. However, this requires more memory than running a single service, and it reduces the maximum load sustainable by any given service. The exact details depend strongly on your usage patterns. More information on optimal configurations will be available in Apple's Tech Info Library at til.info.apple.com.

Q. Do all these services use the same user and group information?

A. No. Apple file services (and NFS) use the native users and groups based on NetInfo, allowing the information to be shared among computers. Macintosh Manager maintains its own user and group information, as does Apache. WebObjects applications can be designed to work with Apache users and groups, but often verify against the underlying database used by the application.

Q. Is a backup utility available with Mac OS X Server?

A. No. A native backup solution is being developed by the Omni Group and will be available free to Mac OS X Server customers at <http://www.omnigroup.com/Software/Backup>.

DISCUSSION

Q. What are the advantages of the NetBoot server?

A. The NetBoot server makes it easy to manage a network of Macintosh computers. With a traditional network, adding an application or changing a system component requires administrators to physically update every computer on the network. NetBoot-capable Macintosh computers--called NetBoot clients--share the same System Folder and applications stored on the NetBoot server. Updating the shared System Folder or adding an application to the server immediately updates every NetBoot client on the network. The shared system components are protected to prevent users from corrupting the system. Since new NetBoot client computers on the network don't require any configuration, adding one system or creating a new lab of computers is fast and simple. Users also have access to their applications, documents, and personal desktop environment at any Macintosh on the network.

Q. Who should use the NetBoot server?

A. The NetBoot server is designed for any organization using Macintosh computers on a network. It helps educators bring technology to the classroom with low-cost, easy-to-manage computers like the iMac. NetBoot helps educators who want to:

- Improve the student to computer ratio.
- Achieve technology goals under tight fiscal constraints.
- Reduce the cost of managing their computing infrastructure.
- Use existing technology resources.

The NetBoot server is also ideal for business customers with Macintosh networks, particularly those who want to replace data entry or editorial terminals. It allows them to reduce their computer costs through low-cost Macintosh hardware and reduced administration requirements.

Q. What components are included with the NetBoot server?

A. The NetBoot server runs on Macintosh G3 computers with the Mac OS X Server operating system. NetBoot includes:

- Three server applications: a BootP server, an AFP server, and a Macintosh Management server.
- Mac OS 8.5.1 system software and accompanying applications used by the NetBoot client computers.
- Two administration applications: NetBoot Desktop Admin for installing applications for use by NetBoot clients, and Macintosh Manager for administering users and groups on the network.

Q. What types of Macintosh computers can I use with the NetBoot server?

A. All iMac computers and the new Power Macintosh G3 (Blue and White) computers introduced at Macworld 1999 have the necessary hardware and firmware needed to support NetBoot. Future Macintosh computers may also be NetBoot-capable.

Q. What is Macintosh Manager, and how does it interact with At Ease for Workgroups?

A. Macintosh Manager is a technology for storing the user's computing environment on the server, so that the user can obtain his or her environment from any Macintosh on the network. This can include application preferences, desktop patterns, and fonts, depending on the level of customization allowed by the administrator. Macintosh Manager is based on, and can be considered a replacement for, At Ease for Workgroups, an earlier Apple product available only to education customers. Macintosh Manager on Mac OS X Server systems can serve both NetBoot and non-NetBoot clients.

Q. Can I manage non-NetBoot clients with Macintosh Manager?

A. Yes. An installer is provided that adds the necessary components to non-NetBoot Macintosh computers.

Q. Can other Mac systems be upgraded to support NetBoot?

A. No. Systems that are not NetBoot-capable can only take advantage of the file, Web, and Macintosh Management services of Mac OS X Server.

Q. How does a Macintosh start up from the network?

A. At startup, the NetBoot client computer broadcasts a BootP request on the network. BootP is a standard industry protocol for allowing computers to discover information about their network settings and the location of files to execute from a network server. The NetBoot server receives the BootP request and replies to the client's request with the information needed to start up. The client uses the information to configure its network settings and begins a TFTP download of the Mac OS into RAM. The client uses this file to finish booting.

Q. How do I set up a Macintosh to start up from the server?

A. A NetBoot-capable Macintosh requires no software setup to start up from the NetBoot server. To make a Macintosh boot the first time, hold down the N key until the Mac OS logo appears. After the computer is booted, simply set the Startup Disk Control Panel to start up from the network drive. From then on, the Macintosh will boot from the network without the aid of the N key.

Q. What version of the Mac OS runs on a NetBoot client?

A. NetBoot clients run Mac OS 8.5.1 with some minor modifications. These modifications allow the Macintosh to operate over the network and do not affect the user experience.

Q. Do I need special applications for NetBoot client computers?

A. NetBoot clients run most Macintosh applications available today. NetBoot does not include any special provisions for software licensing. You need to work with individual vendors to ensure that you have the appropriate number of licenses required by each application used on NetBoot clients.

Q. Does a NetBoot client use its own hard disk drive?

A. The NetBoot client does not normally use its hard disk drive. The NetBoot software includes a special system extension that unmounts the local hard disk drive, making it unavailable to the user. Administrators can disable this extension and make the local drive available for use. The local drive can be used normally for storing files and applications and providing disk space for the computer's virtual memory requirements.

Q. If there is no local hard disk drive, where are files stored?

A. In the NetBoot environment, every user has a home folder. These home folders can be located on the NetBoot server or on any AppleShare server connected to the network. The user's home folder appears on the desktop whenever the user logs in. Users can access their home folders via AppleShare from any Macintosh on the network, not just from NetBoot clients.

Q. Why do users log in to their computers?

A. The NetBoot server maintains a directory of users. When users log in, the server provides them with their personal desktop and data files, no matter which computer on the network they are using. It also provides a security mechanism for protecting the network from rogue users.

Q. What are the NetBoot server requirements?

A. The NetBoot server requires Mac OS X Server software running on a Macintosh G3 computer. The minimum recommended configuration is a 5GB hard disk and 64MB of RAM.

A server can support different quantities of client computers, depending on its configuration.

Q. What are the networking requirements?

A. The NetBoot server should connect to the network at no less than 100 Mbps for each connected port. NetBoot clients should also have at least 100-Mbps shared connections or 10-Mbps switched (dedicated) connections.

Q. Can NetBoot be used across the Internet?

A. No. Currently the NetBoot server is designed only for use on 100-Mbps Ethernet networks.

Q. Is Apple making "diskless" computers?

A. No. NetBoot gives users the flexibility to boot their computers from the local hard disk drive or from the NetBoot server.

Q. How does NetBoot relate to Apple Network Assistant and At Ease?

A. Apple has continually evolved Apple Network Assistant and At Ease for better system management of Macintosh clients. NetBoot takes system management one step further and introduces a new model for keeping Mac clients up to date. Many of the features in Apple Network Assistant and At Ease are incorporated in NetBoot. Apple will continue to develop these products to support Mac clients that are not NetBoot-capable.

DISCUSSION

Q. What are the hardware requirements for Mac OS X Server?

A. Mac OS X Server requires a Power Macintosh G3/Macintosh Server G3 with at least 64MB of memory and a 1GB hard disk drive. For heavily loaded servers, at least 128MB of RAM is recommended, and 200MB or more for multiple services. Mac OS X Server is supported only on Power Macintosh G3 and Macintosh Server G3 computers in their shipped configuration.

Q. To what extent does Mac OS X Server work with added third party hardware?

A. The extent to which Mac OS X Server will interoperate with third party hardware and software will vary from one product to another. Consult with the developer of the hardware or software in question to determine it's compatibility with Mac OS X Server. The Macintosh Products guide at: <http://www.macsoftware.apple.com/> provides a forum for developers to showcase their products and is an excellent starting point for those searching for specific hardware or software solutions.

Q. Will Mac OS X Server be available for Intel machines?

A. Apple has no plans to provide Mac OS X Server for any architecture other than PowerPC.

Q. Does Mac OS X Server support all the Power Macintosh G3 build-to-order options?

A. No. It supports ATA and SCSI drives, Ethernet, and limited USB (for keyboard and mouse). There is currently no support for serial ports, FireWire, or LocalTalk.

Q. Does Mac OS X Server support RAID?

A. Mac OS X Server does not include RAID software. However, it is compatible with a number of Ultra2 SCSI-based RAID devices, including those from MicroNet.

DISCUSSION

Q. What is the price of Mac OS X Server?

A. In the United States Mac OS X Server software is USD499 and is available to education customers for USD249. The hardware configuration, Macintosh Server G3 with Mac OS X Server, is USD4,999.

Q. What licensing do I get for that price?

A. Just about everything. You get unlimited client access (as much as your hardware can handle) for:

- Apache Web server
- Apple file services
- NetBoot network startup
- Macintosh Manager (both NetBoot and non-NetBoot systems)

For WebObjects, you get a basic 50-transaction-per-minute deployment license. You can purchase WebObjects upgrade licenses through the normal Apple Enterprise Software channels. For more information, see www.apple.com/webobjects.

Q. What is included in the Macintosh Server G3 with Mac OS X Server configuration?

A. The Macintosh Server G3 with Mac OS X Server includes a 400-MHz PowerPC G3 processor with 1MB of backside cache, 256MB of high-performance PC100 SDRAM, two 9GB 10,000-rpm Ultra2 LVD SCSI hard disk drives, built-in 10/100BASE-T Ethernet connector and four-port 10/100BASE-T Ethernet PCI card, CD-ROM drive, and Mac OS X Server software (preinstalled). This hardware configuration includes an unlimited-client license for Apple file services, NetBoot clients, and Macintosh Manager clients, and a 50-transaction-per-minute deployment license for WebObjects.

Q. What build-to-order (BTO) options are available for the Macintosh Server G3 with Mac OS X Server?

A. The Macintosh Server G3 with Mac OS X Server will offer the following BTO options:

- 256MB, 384MB, 512MB, 768MB, or 1GB of PC100 SDRAM
- Two or three 9GB 10,000-rpm Ultra2 LVD SCSI hard disk drives
- One, two, or three 36GB 7,200-rpm Ultra2 LVD SCSI hard disk drives
- Dual-channel Ultra2 LVD SCSI PCI card with any hard disk drive configuration
- Ultra SCSI PCI card
- Gigabit Ethernet PCI card
- LaCie external DDS-3 tape drive

For up-to-date information about options and availability, visit <http://www.apple.com/store>.

Q. Where will the software and hardware be available?

A. They will be available through most traditional Apple channels, including the online Apple Store, Apple sales agents, and most Apple resellers.

Q. Will the products be available from Apple Enterprise Sales?

A. Yes. For this release, Mac OS X Server will be the only vehicle for purchasing WebObjects 4 for Power Macintosh systems. WebObjects deployment licenses and consulting services will continue to be available solely through Apple Enterprise Sales.

Q. Are there any upgrade or volume discounts?

A. No. This is the first in a new line of server products.

Mac OS: Moving the Control Strip

Article ID: 60241
Created: 4/14/99
Modified: 4/14/99

TOPIC

When I started my computer I noticed the Control Strip is in the middle of the monitor. How do I move it back to where it was before? Why did it move up?

DISCUSSION

To move the Control Strip, hold down the Option key and drag the tab at the end of the Control Strip. The Control Strip always stays on the left or right edge of your monitor. If you drag it more than halfway across the screen, the Control Strip moves to the other edge. If you have more than one monitor, you can drag the Control Strip to the left or right edge of the other monitor as well.

Changing the monitor's resolution from a smaller one to larger one and restarting the computer will move the Control Strip higher up on the display image.

TITLE

Mac OS ROM Update 1.0: Read Me

Article ID: 60408
Created: 6/28/99
Modified: 7/1/99

TOPIC

This article comprises the Read Me for Mac OS ROM Update version 1.0. This software was released by Apple on 28 June 1999 and is available for downloading from the Apple Software Updates Web site. Copy and paste the following URL into your Web browser to access the download directly:

<http://asui.info.apple.com/swupdates.nsf/artnum/n11476>

iMac, Power Macintosh G3 (Blue and White), and PowerBook G3 Series (Bronze keyboard) customer install this update. Requires Mac OS 8.6.

DISCUSSION

About Mac OS ROM Update 1.0

Based on customer and developer feedback, Apple has made improvements to its software for the iMac, Power Macintosh G3 (Blue and White), and PowerBook G3 Series (Bronze keyboard) customers. The Mac OS ROM Update 1.0 replaces the Mac OS ROM version 1.4 with version 1.6, which includes the following fixes:

- Fixed an intermittent issue where after startup the keyboard/mouse does not respond when a mouse is attached to the top USB port and a keyboard attached to the bottom USB port."
- A possible crash on the PowerBook G3 when removing an attached USB keyboard at the same time as putting the unit to sleep.
- Hot swapping a media bay device into a bronze keyboard PowerBook G3 would not always recognize the device.
- Using the Target Disk Mode feature on the bronze keyboard PowerBook G3, a user can only use the SCSI ID setting of 2.

Who needs the Mac OS ROM Update?

Apple recommends that every iMac, Power Macintosh G3 (Blue and White), and PowerBook G3 Series (Bronze keyboard) customer install this update.

Before you install

- Your iMac, Power Macintosh G3 or PowerBook G3 must have Mac OS 8.6.
- If you are using software that runs in the background, such as virus-protection or security software, turn it off before you install Mac OS ROM Update 1.0.

Important: Installing this upgrade will not affect files stored on your hard disk. However, it is highly recommended that you back up the data on your computer before installing this update. Apple is not responsible for any lost data.

Installing the Mac OS ROM update

1. Follow the instructions on Apple's Support web site (<http://www.apple.com/swupdates>) and download the Mac OS ROM Update 1.0.
2. Double-click the Mac OS ROM Update file to open it. A Mac OS ROM Update icon appears on the Desktop. Note: If there was a problem downloading the file, an error message appears. Try downloading the file again.
3. Double-click the Mac OS ROM Update icon to open the folder.
4. Double-click the Installer icon and follow the onscreen instructions.
5. When a message appears saying installation was successful, click OK. Your computer will restart.

After you install

If you perform a clean installation of Mac OS 8.6 after you've installed Mac OS ROM Update 1.0, the updated MacOS ROM file 1.6 may

be replaced with an older version and you may need to reinstall this update.

To see if you need to reinstall the Mac OS ROM Update, open the Apple menu and choose Apple System Profiler. Under the System Profile tab, locate "Production Information" at the bottom of the window. Click the triangle to open the Production Information contents if it is not already open. The "MacOS ROM file version" should be 1.6 or later. If it is not, follow the instructions for "Installing the Update" above.

For further information, please point your web browser to: <http://www.apple.com/support>

Writers Notes

When connecting a keyboard and mouse via USB, Apple recommends connecting the mouse to the keyboard, and the keyboard to the computer.

Mac OS ROM version 1.6 is already installed on most PowerBook G3 Series (Bronze keyboard) computers. Check the version number of the Mac OS ROM file to determine whether this update may be required.

NetBoot client images should also be updated to version 1.6 of the Mac OS ROM. For instructions on updating the NetBoot client image, refer to Tech Info Library article:

Article 60363: **Mac OS X Server: Updating the NetBoot HD.img to Mac OS 8.6.**

TITLE

Mac OS 9: Performing a Clean Installation

Article ID: 60496
Created: 9/30/99
Modified: 12/21/99

TOPIC

This article provides instructions for what is commonly called a clean installation of system software. A normal system software installation replaces changed system files and adds new ones, but leaves other files alone. A clean installation creates a completely new System Folder on your hard disk.

DISCUSSION

Performing a clean installation can be a lengthy procedure, but if you have tried other troubleshooting methods and are still experiencing problems, it may help.

1. Start up your computer from the Mac OS CD.
2. Open the Mac OS Installer application.
3. In the Select Destination window of the Installer, click the Options button.
4. Click the Perform Clean Installation checkbox to select it, then click OK.
5. Follow the onscreen instructions to begin the installation. When the installation is finished, you can reinstall extensions, fonts, control panels, applications, and other items not installed with the Mac OS from their original disks. If you don't have the original disks, you can drag the items one at a time from the Previous System Folder to the new System Folder. To make sure the software is compatible with this version of the Mac OS, you should restart your computer after you reinstall each item.

Important A clean installation creates a completely new System Folder. This means you must reinstall any non-Apple extensions, fonts, and control panels after you do the installation. Before you begin, write down your Internet settings (from the Modem, TCP/IP, and Remote Access control panels). Some of your application programs might also need to be reinstalled after you perform a clean installation, particularly if they rely on files that used to be in the System Folder.

After you're sure you've copied all the items you want to save into your new System Folder, delete the Previous System Folder from your hard disk.
